About	1
Chapter 1: Getting started with MySQL	2
Section 1.1: Getting Started	2
Section 1.2: Information Schema Examples	6
Chapter 2: Data Types	7
Section 2.1: CHAR(n)	7
Section 2.2: DATE, DATETIME, TIMESTAMP, YEAR, and TIME	7
Section 2.3: VARCHAR(255) -- or not	8
Section 2.4: INT as AUTO_INCREMENT	8
Section 2.5: Others	8
Section 2.6: Implicit / automatic casting	9
Section 2.7: Introduction (numeric)	9
Section 2.8: Integer Types	10
Section 2.9: Fixed Point Types	10
Section 2.10: Floating Point Types	10
Section 2.11: Bit Value Type	11
Chapter 3: SELECT	12
Section 3.1: SELECT with DISTINCT	12
Section 3.2: SELECT all columns (*)	12
Section 3.3: SELECT by column name	13
Section 3.4: SELECT with LIKE (%)	13
Section 3.5: SELECT with CASE or IF	15
Section 3.6: SELECT with Alias (AS)	15
Section 3.7: SELECT with a LIMIT clause	16
Section 3.8: SELECT with BETWEEN	16
Section 3.9: SELECT with WHERE	18
Section 3.10: SELECT with LIKE()	18
Section 3.11: SELECT with date range	19
Chapter 4: Backticks	20
Section 4.1: Backticks usage	20
Chapter 5: NULL	21
Section 5.1: Uses for NULL	21
Section 5.2: Testing NULLs	21
Chapter 6: Limit and Offset	22
Section 6.1: Limit and Offset relationship	22
Chapter 7: Creating databases	24
Section 7.1: Create database, users, and grants	24
Section 7.2: Creating and Selecting a Database	26
Section 7.3: MyDatabase	26
Section 7.4: System Databases	27
Chapter 8: Using Variables	28
Section 8.1: Setting Variables	28
Section 8.2: Row Number and Group By using variables in Select Statement	29
Chapter 9: Comment MySQL	31
Section 9.1: Adding comments	31
Section 9.2: Commenting table definitions	31

Chapter 10: INSERT	32
Section 10.1: INSERT, ON DUPLICATE KEY UPDATE	32
Section 10.2: Inserting multiple rows	32
Section 10.3: Basic Insert	33
Section 10.4: INSERT with AUTO_INCREMENT + LAST_INSERT_ID()	33
Section 10.5: INSERT SELECT (Inserting data from another Table)	35
Section 10.6: Lost AUTO_INCREMENT ids	35
Chapter 11: DELETE	37
Section 11.1: Multi-Table Deletes	37
Section 11.2: DELETE vs TRUNCATE	38
Section 11.3: Multi-table DELETE	39
Section 11.4: Basic delete	39
Section 11.5: Delete with Where clause	39
Section 11.6: Delete all rows from a table	39
Section 11.7: LIMITing deletes	39
Chapter 12: UPDATE	41
Section 12.1: Update with Join Pattern	41
Section 12.2: Basic Update	41
Section 12.3: Bulk UPDATE	42
Section 12.4: UPDATE with ORDER BY and LIMIT	42
Section 12.5: Multiple Table UPDATE	42
Chapter 13: ORDER BY	44
Section 13.1: Contexts	44
Section 13.2: Basic	44
Section 13.3: ASCending / DESCending	44
Section 13.4: Some tricks	44
Chapter 14: Group By	46
Section 14.1: GROUP BY using HAVING	46
Section 14.2: Group By using Group Concat	46
Section 14.3: Group By Using MIN function	46
Section 14.4: GROUP BY with AGGREGATE functions	47
Chapter 15: Error 1055: ONLY_FULL_GROUP_BY: something is not in GROUP BY clause	
...	50
Section 15.1: Misusing GROUP BY to return unpredictable results: Murphy's Law	50
Section 15.2: Misusing GROUP BY with SELECT *, and how to fix it	50
Section 15.3: ANY_VALUE()	51
Section 15.4: Using and misusing GROUP BY	51
Chapter 16: Joins	53
Section 16.1: Joins visualized	53
Section 16.2: JOIN with subquery ("Derived" table)	53
Section 16.3: Full Outer Join	54
Section 16.4: Retrieve customers with orders -- variations on a theme	55
Section 16.5: Joining Examples	56
Chapter 17: JOINS: Join 3 table with the same name of id.	57
Section 17.1: Join 3 tables on a column with the same name	57
Chapter 18: UNION	58
Section 18.1: Combining SELECT statements with UNION	58
Section 18.2: Combining data with different columns	58
Section 18.3: ORDER BY	58

Section 18.4: Pagination via OFFSET	58
Section 18.5: Combining and merging data on different MySQL tables with the same columns into unique rows and running query	59
Section 18.6: UNION ALL and UNION	59
Chapter 19: Arithmetic	60
Section 19.1: Arithmetic Operators	60
Section 19.2: Mathematical Constants	60
Section 19.3: Trigonometry (SIN, COS)	60
Section 19.4: Rounding (ROUND, FLOOR, CEIL)	62
Section 19.5: Raise a number to a power (POW)	62
Section 19.6: Square Root (SQRT)	63
Section 19.7: Random Numbers (RAND)	63
Section 19.8: Absolute Value and Sign (ABS, SIGN)	63
Chapter 20: String operations	65
Section 20.1: LENGTH()	66
Section 20.2: CHAR_LENGTH()	66
Section 20.3: HEX(str)	66
Section 20.4: SUBSTRING()	66
Section 20.5: UPPER() / UCASE()	67
Section 20.6: STR_TO_DATE - Convert string to date	67
Section 20.7: LOWER() / LCASE()	67
Section 20.8: REPLACE()	67
Section 20.9: Find element in comma separated list	67
Chapter 21: Date and Time Operations	69
Section 21.1: Date arithmetic	69
Section 21.2: SYSDATE(), NOW(), CURDATE()	69
Section 21.3: Testing against a date range	70
Section 21.4: Extract Date from Given Date or DateTime Expression	70
Section 21.5: Using an index for a date and time lookup	70
Section 21.6: Now()	71
Chapter 22: Handling Time Zones	72
Section 22.1: Retrieve the current date and time in a particular time zone	72
Section 22.2: Convert a stored 'DATE' or 'DATETIME' value to another time zone	72
Section 22.3: Retrieve stored 'TIMESTAMP' values in a particular time zone	72
Section 22.4: What is my server's local time zone setting?	72
Section 22.5: What time_zone values are available in my server?	73
Chapter 23: Regular Expressions	74
Section 23.1: REGEXP / RLIKE	74
Chapter 24: VIEW	76
Section 24.1: Create a View	76
Section 24.2: A view from two tables	77
Section 24.3: DROPPING A VIEW	77
Section 24.4: Updating a table via a VIEW	77
Chapter 25: Table Creation	78
Section 25.1: Table creation with Primary Key	78
Section 25.2: Basic table creation	79
Section 25.3: Table creation with Foreign Key	79
Section 25.4: Show Table Structure	80
Section 25.5: Cloning an existing table	81

Section 25.6: Table Create With TimeStamp Column To Show Last Update	81
Section 25.7: CREATE TABLE FROM SELECT	81
Chapter 26: ALTER TABLE	83
Section 26.1: Changing storage engine; rebuild table; change file_per_table	83
Section 26.2: ALTER COLUMN OF TABLE	83
Section 26.3: Change auto-increment value	83
Section 26.4: Renaming a MySQL table	83
Section 26.5: ALTER table add INDEX	84
Section 26.6: Changing the type of a primary key column	84
Section 26.7: Change column definition	84
Section 26.8: Renaming a MySQL database	84
Section 26.9: Swapping the names of two MySQL databases	85
Section 26.10: Renaming a column in a MySQL table	85
Chapter 27: Drop Table	87
Section 27.1: Drop Table	87
Section 27.2: Drop tables from database	87
Chapter 28: MySQL LOCK TABLE	88
Section 28.1: Row Level Locking	88
Section 28.2: Mysql Locks	89
Chapter 29: Error codes	91
Section 29.1: Error code 1064: Syntax error	91
Section 29.2: Error code 1175: Safe Update	91
Section 29.3: Error code 1215: Cannot add foreign key constraint	91
Section 29.4: 1067, 1292, 1366, 1411 - Bad Value for number, date, default, etc	93
Section 29.5: 1045 Access denied	93
Section 29.6: 1236 "impossible position" in Replication	93
Section 29.7: 2002, 2003 Cannot connect	94
Section 29.8: 126, 127, 134, 144, 145	94
Section 29.9: 139	94
Section 29.10: 1366	94
Section 29.11: 126, 1054, 1146, 1062, 24	95
Chapter 30: Stored routines (procedures and functions)	97
Section 30.1: Stored procedure with IN, OUT, INOUT parameters	97
Section 30.2: Create a Function	98
Section 30.3: Cursors	99
Section 30.4: Multiple ResultSets	100
Section 30.5: Create a function	100
Chapter 31: Indexes and Keys	102
Section 31.1: Create index	102
Section 31.2: Create unique index	102
Section 31.3: AUTO INCREMENT key	102
Section 31.4: Create composite index	102
Section 31.5: Drop index	103
Chapter 32: Full-Text search	104
Section 32.1: Simple FULLTEXT search	104
Section 32.2: Simple BOOLEAN search	104
Section 32.3: Multi-column FULLTEXT search	104
Chapter 33: PREPARE Statements	106
Section 33.1: PREPARE, EXECUTE and DEALLOCATE PREPARE Statements	106

Section 33.2: Alter table with add column	106
Chapter 34: JSON	107
Section 34.1: Create simple table with a primary key and JSON field	107
Section 34.2: Insert a simple JSON	107
Section 34.3: Updating a JSON field	107
Section 34.4: Insert mixed data into a JSON field	108
Section 34.5: CAST data to JSON type	108
Section 34.6: Create Json Object and Array	108
Chapter 35: Extract values from JSON type	109
Section 35.1: Read JSON Array value	109
Section 35.2: JSON Extract Operators	109
Chapter 36: MySQL Admin	111
Section 36.1: Atomic RENAME & Table Reload	111
Section 36.2: Change root password	111
Section 36.3: Drop database	111
Chapter 37: TRIGGERS	112
Section 37.1: Basic Trigger	112
Section 37.2: Types of triggers	112
Chapter 38: Configuration and tuning	114
Section 38.1: InnoDB performance	114
Section 38.2: Parameter to allow huge data to insert	114
Section 38.3: Increase the string limit for group_concat	114
Section 38.4: Minimal InnoDB configuration	114
Section 38.5: Secure MySQL encryption	115
Chapter 39: Events	116
Section 39.1: Create an Event	116
Chapter 40: ENUM	119
Section 40.1: Why ENUM?	119
Section 40.2: VARCHAR as an alternative	119
Section 40.3: Adding a new option	119
Section 40.4: NULL vs NOT NULL	119
Chapter 41: Install Mysql container with Docker-Compose	121
Section 41.1: Simple example with docker-compose	121
Chapter 42: Character Sets and Collations	122
Section 42.1: Which CHARACTER SET and COLLATION?	122
Section 42.2: Setting character sets on tables and fields	122
Section 42.3: Declaration	122
Section 42.4: Connection	123
Chapter 43: MyISAM Engine	124
Section 43.1: ENGINE=MyISAM	124
Chapter 44: Converting from MyISAM to InnoDB	125
Section 44.1: Basic conversion	125
Section 44.2: Converting All Tables in one Database	125
Chapter 45: Transaction	126
Section 45.1: Start Transaction	126
Section 45.2: COMMIT , ROLLBACK and AUTOCOMMIT	127
Section 45.3: Transaction using JDBC Driver	129
Chapter 46: Log files	132

Section 46.1: Slow Query Log	132
Section 46.2: A List	132
Section 46.3: General Query Log	133
Section 46.4: Error Log	134
Chapter 47: Clustering	136
Section 47.1: Disambiguation	136
Chapter 48: Partitioning	137
Section 48.1: RANGE Partitioning	137
Section 48.2: LIST Partitioning	137
Section 48.3: HASH Partitioning	138
Chapter 49: Replication	139
Section 49.1: Master - Slave Replication Setup	139
Section 49.2: Replication Errors	141
Chapter 50: Backup using mysqldump	143
Section 50.1: Specifying username and password	143
Section 50.2: Creating a backup of a database or table	143
Section 50.3: Restoring a backup of a database or table	144
Section 50.4: Tranferring data from one MySQL server to another	144
Section 50.5: mysqldump from a remote server with compression	145
Section 50.6: restore a gzipped mysqldump file without uncompressing	145
Section 50.7: Backup database with stored procedures and functions	145
Section 50.8: Backup direct to Amazon S3 with compression	145
Chapter 51: mysqlimport	146
Section 51.1: Basic usage	146
Section 51.2: Using a custom field-delimiter	146
Section 51.3: Using a custom row-delimiter	146
Section 51.4: Handling duplicate keys	146
Section 51.5: Conditional import	147
Section 51.6: Import a standard csv	147
Chapter 52: LOAD DATA INFILE	148
Section 52.1: using LOAD DATA INFILE to load large amount of data to database	148
Section 52.2: Load data with duplicates	149
Section 52.3: Import a CSV file into a MySQL table	149
Chapter 53: MySQL Unions	150
Section 53.1: Union operator	150
Section 53.2: Union ALL	150
Section 53.3: UNION ALL With WHERE	151
Chapter 54: MySQL client	152
Section 54.1: Base login	152
Section 54.2: Execute commands	152
Chapter 55: Temporary Tables	154
Section 55.1: Create Temporary Table	154
Section 55.2: Drop Temporary Table	154
Chapter 56: Customize PS1	155
Section 56.1: Customize the MySQL PS1 with current database	155
Section 56.2: Custom PS1 via MySQL configuration file	155
Chapter 57: Dealing with sparse or missing data	156
Section 57.1: Working with columns containing NULL values	156

Chapter 58: Connecting with UTF-8 Using Various Programming language	159
Section 58.1: Python	159
Section 58.2: PHP	159
Chapter 59: Time with subsecond precision	160
Section 59.1: Get the current time with millisecond precision	160
Section 59.2: Get the current time in a form that looks like a Javascript timestamp	160
Section 59.3: Create a table with columns to store sub-second time	160
Section 59.4: Convert a millisecond-precision date / time value to text	160
Section 59.5: Store a Javascript timestamp into a TIMESTAMP column	161
Chapter 60: One to Many	162
Section 60.1: Example Company Tables	162
Section 60.2: Get the Employees Managed by a Single Manager	162
Section 60.3: Get the Manager for a Single Employee	162
Chapter 61: Server Information	164
Section 61.1: SHOW VARIABLES example	164
Section 61.2: SHOW STATUS example	164
Chapter 62: SSL Connection Setup	166
Section 62.1: Setup for Debian-based systems	166
Section 62.2: Setup for CentOS7 / RHEL7	168
Chapter 63: Create New User	173
Section 63.1: Create a MySQL User	173
Section 63.2: Specify the password	173
Section 63.3: Create new user and grant all privileges to schema	173
Section 63.4: Renaming user	173
Chapter 64: Security via GRANTS	174
Section 64.1: Best Practice	174
Section 64.2: Host (of user@host)	174
Chapter 65: Change Password	175
Section 65.1: Change MySQL root password in Linux	175
Section 65.2: Change MySQL root password in Windows	175
Section 65.3: Process	176
Chapter 66: Recover and reset the default root password for MySQL 5.7+	177
Section 66.1: What happens when the initial start up of the server	177
Section 66.2: How to change the root password by using the default password	177
Section 66.3: reset root password when "/var/run/mysqld" for UNIX socket file don't exists"	177
Chapter 67: Recover from lost root password	180
Section 67.1: Set root password, enable root user for socket and http access	180
Chapter 68: MySQL Performance Tips	181
Section 68.1: Building a composite index	181
Section 68.2: Optimizing Storage Layout for InnoDB Tables	181
Chapter 69: Performance Tuning	183
Section 69.1: Don't hide in function	183
Section 69.2: OR	183
Section 69.3: Add the correct index	183
Section 69.4: Have an INDEX	184
Section 69.5: Subqueries	184
Section 69.6: JOIN + GROUP BY	184
Section 69.7: Set the cache correctly	185

Section 69.8: Negatives	185
Appendix A: Reserved Words	186
Section A.1: Errors due to reserved words	186
Credits	187

Chapter 1: Getting started with MySQL

Version Release Date

1.0	1995-05-23
3.19	1996-12-01
3.20	1997-01-01
3.21	1998-10-01
3.22	1999-10-01
3.23	2001-01-22
4.0	2003-03-01
4.1	2004-10-01
5.0	2005-10-01
5.1	2008-11-27
5.5	2010-11-01
5.6	2013-02-01
5.7	2015-10-01

Section 1.1: Getting Started

Creating a database in MySQL

```
CREATE DATABASE mydb;
```

Return value:

```
Query OK, 1 row affected (0.05 sec)
```

Using the created database mydb

```
USE mydb;
```

Return value:

```
Database Changed
```

Creating a table in MySQL

```
CREATE TABLE mytable
(
  id                int unsigned NOT NULL auto_increment,
  username          varchar(100) NOT NULL,
  email             varchar(100) NOT NULL,
  PRIMARY KEY      (id)
);
```

CREATE TABLE mytable will create a new table called mytable.

id int unsigned NOT NULL auto_increment creates the id column, this type of field will assign a unique numeric ID to each record in the table (meaning that no two rows can have the same id in this case), MySQL will automatically assign a new, unique value to the record's id field (starting with 1).

Return value:

```
Query OK, 0 rows affected (0.10 sec)
```

Inserting a row into a MySQL table

```
INSERT INTO mytable ( username, email )  
VALUES ( "myuser", "myuser@example.com" );
```

Example return value:

```
Query OK, 1 row affected (0.06 sec)
```

The **varchar** a.k.a strings can be also be inserted using single quotes:

```
INSERT INTO mytable ( username, email )  
VALUES ( 'username', 'username@example.com' );
```

Updating a row into a MySQL table

```
UPDATE mytable SET username="myuser" WHERE id=8
```

Example return value:

```
Query OK, 1 row affected (0.06 sec)
```

The **int** value can be inserted in a query without quotes. Strings and Dates must be enclosed in single quote ' or double quotes ".

Deleting a row into a MySQL table

```
DELETE FROM mytable WHERE id=8
```

Example return value:

```
Query OK, 1 row affected (0.06 sec)
```

This will delete the row having id is 8.

Selecting rows based on conditions in MySQL

```
SELECT * FROM mytable WHERE username = "myuser";
```

Return value:

```
+----+-----+-----+  
| id | username | email |  
+----+-----+-----+  
| 1 | myuser | myuser@example.com |
```

```
+-----+-----+-----+-----+
```

1 row in set (0.00 sec)

Show list of existing databases

```
SHOW databases;
```

Return value:

```
+-----+
| Databases |
+-----+
| information_schema |
| mydb         |
+-----+
```

2 rows in set (0.00 sec)

You can think of "information_schema" as a "master database" that provides access to database metadata.

Show tables in an existing database

```
SHOW tables;
```

Return value:

```
+-----+
| Tables_in_mydb |
+-----+
| mytable        |
+-----+
```

1 row in set (0.00 sec)

Show all the fields of a table

```
DESCRIBE databaseName.tableName;
```

or, if already using a database:

```
DESCRIBE tableName;
```

Return value:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
```

fieldname	fieldvalue	type	NO/YES	keytype	defaultfieldvalue	
-----	-----	-----	-----	-----	-----	-----

Extra may contain **auto_increment** for example.

Key refers to the type of key that may affect the field. Primary (PRI), Unique (UNI) ...

```
n row in set (0.00 sec)
```

Where n is the number of fields in the table.

Creating user

First, you need to create a user and then give the user permissions on certain databases/tables. While creating the user, you also need to specify where this user can connect from.

```
CREATE USER 'user'@'localhost' IDENTIFIED BY 'some_password';
```

Will create a user that can only connect on the local machine where the database is hosted.

```
CREATE USER 'user'@'%' IDENTIFIED BY 'some_password';
```

Will create a user that can connect from anywhere (except the local machine).

Example return value:

```
Query OK, 0 rows affected (0.00 sec)
```

Adding privileges

Grant common, basic privileges to the user for all tables of the specified database:

```
GRANT SELECT, INSERT, UPDATE ON databaseName.* TO 'userName'@'localhost';
```

Grant all privileges to the user for all tables on all databases (attention with this):

```
GRANT ALL ON *.* TO 'userName'@'localhost' WITH GRANT OPTION;
```

As demonstrated above, ***.*** targets all databases and tables, **databaseName.*** targets all tables of the specific database. It is also possible to specify database and table like so **databaseName.tableName**.

WITH GRANT OPTION should be left out if the user need not be able to grant other users privileges.

Privileges can be **either**

```
ALL
```

or a combination of the following, each separated by a comma (non-exhaustive list).

```
SELECT
INSERT
UPDATE
```

DELETE
CREATE
DROP

Note

Generally, you should try to avoid using column or table names containing spaces or using reserved words in SQL. For example, it's best to avoid names like **table** or **first** name.

If you must use such names, put them between back-tick `` delimiters. For example:

```
CREATE TABLE `table`  
(  
  `first name` VARCHAR(30)  
);
```

A query containing the back-tick delimiters on this table might be:

```
SELECT `first name` FROM `table` WHERE `first name` LIKE 'a%';
```

Section 1.2: Information Schema Examples

Processlist

This will show all active & sleeping queries in that order then by how long.

```
SELECT * FROM information_schema.PROCESSLIST ORDER BY INFO DESC, TIME DESC;
```

This is a bit more detail on time-frames as it is in seconds by default

```
SELECT ID, USER, HOST, DB, COMMAND,  
TIME as time_seconds,  
ROUND(TIME / 60, 2) as time_minutes,  
ROUND(TIME / 60 / 60, 2) as time_hours,  
STATE, INFO  
FROM information_schema.PROCESSLIST ORDER BY INFO DESC, TIME DESC;
```

Stored Procedure Searching

Easily search thru all Stored Procedures for words and wildcards.

```
SELECT * FROM information_schema.ROUTINES WHERE ROUTINE_DEFINITION LIKE '%word%';
```

Chapter 2: Data Types

Section 2.1: CHAR(n)

`CHAR(n)` is a string of a *fixed* length of *n* characters. If it is `CHARACTER SET utf8mb4`, that means it occupies exactly $4 \times n$ bytes, regardless of what text is in it.

Most use cases for `CHAR(n)` involve strings that contain English characters, hence should be `CHARACTER SET ascii`. (latin1 will do just as good.)

```
country_code CHAR(2) CHARACTER SET ascii,  
postal_code CHAR(6) CHARACTER SET ascii,  
uuid CHAR(39) CHARACTER SET ascii, -- more discussion elsewhere
```

Section 2.2: DATE, DATETIME, TIMESTAMP, YEAR, and TIME

The `DATE` datatype comprises the date but no time component. Its format is `'YYYY-MM-DD'` with a range of `'1000-01-01'` to `'9999-12-31'`.

The `DATETIME` type includes the time with a format of `'YYYY-MM-DD HH:MM:SS'`. It has a range from `'1000-01-01 00:00:00'` to `'9999-12-31 23:59:59'`.

The `TIMESTAMP` type is an integer type comprising date and time with an effective range from `'1970-01-01 00:00:01'` UTC to `'2038-01-19 03:14:07'` UTC.

The `YEAR` type represents a year and holds a range from 1901 to 2155.

The `TIME` type represents a time with a format of `'HH:MM:SS'` and holds a range from `'-838:59:59'` to `'838:59:59'`.

Storage Requirements:

Data Type	Before MySQL 5.6.4	as of MySQL 5.6.4
YEAR	1 byte	1 byte
DATE	3 bytes	3 bytes
TIME	3 bytes	3 bytes + fractional seconds storage
DATETIME	8 bytes	5 bytes + fractional seconds storage
TIMESTAMP	4 bytes	4 bytes + fractional seconds storage

Fractional Seconds (as of Version 5.6.4):

Fractional Seconds Precision	Storage Required
0	0 bytes
1,2	1 byte
3,4	2 byte
5,6	3 byte

See the MySQL Manual Pages [DATE, DATETIME, and TIMESTAMP Types](#), [Data Type Storage Requirements](#), and [Fractional Seconds in Time Values](#).

Section 2.3: VARCHAR(255) -- or not

Suggested max len

First, I will mention some common strings that are always hex, or otherwise limited to ASCII. For these, you should specify CHARACTER SET `ascii` (latin1 is ok) so that it will not waste space:

```
UUID CHAR(36) CHARACTER SET ascii -- or pack into BINARY(16)
country_code CHAR(2) CHARACTER SET ascii
ip_address CHAR(39) CHARACTER SET ascii -- or pack into BINARY(16)
phone VARCHAR(20) CHARACTER SET ascii -- probably enough to handle extension
postal_code VARCHAR(20) CHARACTER SET ascii -- (not 'zip_code') (don't know the max

city VARCHAR(100) -- This Russian town needs 91:
    Poselok Uchebnogo Khozyaystva Srednego Professionalno-Tekhnicheskoye Uchilishche Nomer Odin
country VARCHAR(50) -- probably enough
name VARCHAR(64) -- probably adequate; more than some government agencies allow
```

Why not simply 255? There are two reasons to avoid the common practice of using (255) for everything.

- When a complex **SELECT** needs to create temporary table (for a subquery, **UNION**, **GROUP BY**, etc), the preferred choice is to use the MEMORY engine, which puts the data in RAM. But VARCHARs are turned into **CHAR** in the process. This makes **VARCHAR(255) CHARACTER SET utf8mb4** take 1020 bytes. That can lead to needing to spill to disk, which is slower.
- In certain situations, InnoDB will look at the potential size of the columns in a table and decide that it will be too big, aborting a **CREATE TABLE**.

VARCHAR versus TEXT

Usage hints for ***TEXT**, **CHAR**, and **VARCHAR**, plus some Best Practice:

- Never use **TINYTEXT**.
- Almost never use **CHAR** -- it is fixed length; each character is the max length of the CHARACTER SET (eg, 4 bytes/character for utf8mb4).
- With **CHAR**, use CHARACTER SET `ascii` unless you know otherwise.
- **VARCHAR(n)** will truncate at *n characters*; **TEXT** will truncate at some number of *bytes*. (But, do you want truncation?)
- ***TEXT** may slow down complex SELECTs due to how temp tables are handled.

Section 2.4: INT as AUTO_INCREMENT

Any size of **INT** may be used for **AUTO_INCREMENT**. **UNSIGNED** is always appropriate.

Keep in mind that certain operations "burn" **AUTO_INCREMENT** ids. This could lead to an unexpected gap. Examples: **INSERT IGNORE** and **REPLACE**. They *may* preallocate an id *before* realizing that it won't be needed. This is expected behavior and by design in the InnoDB engine and should not discourage their use.

Section 2.5: Others

There is already a separate entry for "FLOAT, DOUBLE, and DECIMAL" and "ENUM". A single page on datatypes is likely to be unwieldy -- I suggest "Field types" (or should it be called "Datatypes"?) be an overview, then split into these topic pages:

- INTs
- FLOAT, DOUBLE, and DECIMAL

- Strings (CHARs, TEXT, etc)
- BINARY and BLOB
- DATETIME, TIMESTAMP, and friends
- ENUM and SET
- Spatial data
- JSON type (MySQL 5.7.8+)
- How to represent Money, and other common 'types' that need shoehorning into existing datatypes

Where appropriate, each topic page should include, in addition to syntax and examples:

- Considerations when ALTERing
- Size (bytes)
- Contrast with non-MySQL engines (low priority)
- Considerations when using the datatype in a PRIMARY KEY or secondary key
- other Best Practice
- other Performance issues

(I assume this "example" will self-destruct when my suggestions have been satisfied or vetoed.)

Section 2.6: Implicit / automatic casting

```
select '123' * 2;
```

To make the **multiplication** with 2 MySQL automatically converts the string 123 into a number.

Return value:

```
246
```

The conversion to a number starts from left to right. If the conversion is not possible the result is 0

```
select '123ABC' * 2
```

Return value:

```
246
```

```
select 'ABC123' * 2
```

Return value:

```
0
```

Section 2.7: Introduction (numeric)

MySQL offers a number of different numeric types. These can be broken down into

Group	Types
Integer Types	INTEGER, INT, SMALLINT, TINYINT, MEDIUMINT, BIGINT

Fixed Point Types **DECIMAL**, **NUMERIC**
Floating Point Types **FLOAT**, **DOUBLE**
Bit Value Type **BIT**

Section 2.8: Integer Types

Minimal unsigned value is always 0.

Type	Storage (Bytes)	Minimum Value (Signed)	Maximum Value (Signed)	Maximum Value (Unsigned)
TINYINT	1	-27 -128	27-1 127	28-1 255
SMALLINT	2	-215 -32,768	215-1 32,767	216-1 65,535
MEDIUMINT	3	-223 -8,388,608	223-1 8,388,607	224-1 16,777,215
INT	4	-231 -2,147,483,648	231-1 2,147,483,647	232-1 4,294,967,295
BIGINT	8	-263 -9,223,372,036,854,775,808	263-1 9,223,372,036,854,775,807	264-1 18,446,744,073,709,551,615

Section 2.9: Fixed Point Types

MySQL's **DECIMAL** and **NUMERIC** types store exact numeric data values. It is recommended to use these types to preserve exact precision, such as for money.

Decimal

These values are stored in binary format. In a column declaration, the precision and scale should be specified

Precision represents the number of significant digits that are stored for values.

Scale represents the number of digits stored *after* the decimal

```
salary DECIMAL (5,2)
```

5 represents the precision and 2 represents the scale. For this example, the range of values that can be stored in this column is **-999.99 to 999.99**

If the scale parameter is omitted, it defaults to 0

This data type can store up to 65 digits.

The number of bytes taken by **DECIMAL** (M, N) is *approximately* $M/2$.

Section 2.10: Floating Point Types

FLOAT and **DOUBLE** represent *approximate* data types.

Type	Storage	Precision	Range
FLOAT	4 bytes	23 significant bits / ~7 decimal digits	$10^{+/-38}$
DOUBLE	8 bytes	53 significant bits / ~16 decimal digits	$10^{+/-308}$

REAL is a synonym for **FLOAT**. **DOUBLE PRECISION** is a synonym for **DOUBLE**.

Although MySQL also permits (M,D) qualifier, do *not* use it. (M,D) means that values can be stored with up to M total

digits, where D can be after the decimal. *Numbers will be rounded twice or truncated; this will cause more trouble than benefit.*

Because floating-point values are approximate and not stored as exact values, attempts to treat them as exact in comparisons may lead to problems. Note in particular that a **FLOAT** value rarely equals a **DOUBLE** value.

Section 2.11: Bit Value Type

The **BIT** type is useful for storing bit-field values. **BIT**(M) allows storage of up to M-bit values where M is in the range of 1 to 64

You can also specify values with **bit value** notation.

```
b'111'      -> 7
b'10000000' -> 128
```

Sometimes it is handy to use 'shift' to construct a single-bit value, for example $(1 \ll 7)$ for 128.

The maximum combined size of all BIT columns in an NDB table is 4096.

Chapter 3: SELECT

SELECT is used to retrieve rows selected from one or more tables.

Section 3.1: SELECT with DISTINCT

The **DISTINCT** clause after **SELECT** eliminates duplicate rows from the result set.

```
CREATE TABLE `car`
(
  `car_id` INT UNSIGNED NOT NULL PRIMARY KEY,
  `name` VARCHAR(20),
  `price` DECIMAL(8,2)
);

INSERT INTO CAR (`car_id`, `name`, `price`) VALUES (1, 'Audi A1', '20000');
INSERT INTO CAR (`car_id`, `name`, `price`) VALUES (2, 'Audi A1', '15000');
INSERT INTO CAR (`car_id`, `name`, `price`) VALUES (3, 'Audi A2', '40000');
INSERT INTO CAR (`car_id`, `name`, `price`) VALUES (4, 'Audi A2', '40000');

SELECT DISTINCT `name`, `price` FROM CAR;
```

```
+-----+-----+
| name   | price   |
+-----+-----+
| Audi A1 | 20000.00 |
| Audi A1 | 15000.00 |
| Audi A2 | 40000.00 |
+-----+-----+
```

DISTINCT works across all columns to deliver the results, not individual columns. The latter is often a misconception of new SQL developers. In short, it is the distinctness at the row-level of the result set that matters, not distinctness at the column-level. To visualize this, look at "Audi A1" in the above result set.

For later versions of MySQL, **DISTINCT** has implications with its use alongside **ORDER BY**. The setting for `ONLY_FULL_GROUP_BY` comes into play as seen in the following MySQL Manual Page entitled [MySQL Handling of GROUP BY](#).

Section 3.2: SELECT all columns (*)

Query

```
SELECT * FROM stack;
```

Result

```
+-----+-----+-----+
| id    | username | password |
+-----+-----+-----+
| 1     | admin    | admin    |
| 2     | stack    | stack    |
+-----+-----+-----+
2 rows in set (0.00 sec)
```

You can select all columns from one table in a join by doing:

```
SELECT stack.* FROM stack JOIN Overflow ON stack.id = Overflow.id;
```

Best Practice Do not use `*` unless you are debugging or fetching the row(s) into associative arrays, otherwise schema changes (ADD/DROP/rearrange columns) can lead to nasty application errors. Also, if you give the list of columns you need in your result set, MySQL's query planner often can optimize the query.

Pros:

1. When you add/remove columns, you don't have to make changes where you did use `SELECT *`
2. It's shorter to write
3. You also see the answers, so can `SELECT *`-usage ever be justified?

Cons:

1. You are returning more data than you need. Say you add a VARBINARY column that contains 200k per row. You only need this data in one place for a single record - using `SELECT *` you can end up returning 2MB per 10 rows that you don't need
2. Explicit about what data is used
3. Specifying columns means you get an error when a column is removed
4. The query processor has to do some more work - figuring out what columns exist on the table (thanks @vinodadhikary)
5. You can find where a column is used more easily
6. You get all columns in joins if you use `SELECT *`
7. You can't safely use ordinal referencing (though using ordinal references for columns is bad practice in itself)
8. In complex queries with `TEXT` fields, the query may be slowed down by less-optimal temp table processing

Section 3.3: SELECT by column name

```
CREATE TABLE stack(  
    id INT,  
    username VARCHAR(30) NOT NULL,  
    password VARCHAR(30) NOT NULL  
);  
  
INSERT INTO stack (`id`, `username`, `password`) VALUES (1, 'Foo', 'hiddenGem');  
INSERT INTO stack (`id`, `username`, `password`) VALUES (2, 'Baa', 'verySecret');
```

Query

```
SELECT id FROM stack;
```

Result

```
+-----+  
| id   |  
+-----+  
|    1 |  
|    2 |  
+-----+
```

Section 3.4: SELECT with LIKE (%)

```
CREATE TABLE stack
```

```
( id int AUTO_INCREMENT PRIMARY KEY,
  username VARCHAR(100) NOT NULL
);

INSERT stack(username) VALUES
('admin'),('k admin'),('adm'),('a adm b'),('b XadmY c'), ('adm now'), ('not here');
```

"adm" anywhere:

```
SELECT * FROM stack WHERE username LIKE "%adm%";
```

id	username
1	admin
2	k admin
3	adm
4	a adm b
5	b XadmY c
6	adm now

Begins with "adm":

```
SELECT * FROM stack WHERE username LIKE "adm%";
```

id	username
1	admin
3	adm
6	adm now

Ends with "adm":

```
SELECT * FROM stack WHERE username LIKE "%adm";
```

id	username
3	adm

Just as the % character in a **LIKE** clause matches any number of characters, the _ character matches just one character. For example,

```
SELECT * FROM stack WHERE username LIKE "adm_n";
```

id	username
1	admin

Performance Notes If there is an index on username, then

- **LIKE** 'adm' performs the same as '=' 'adm'
- **LIKE** 'adm%' is a "range", similar to **BETWEEN**...**AND**... It can make good use of an index on the column.
- **LIKE** '%adm' (or any variant with a *leading* wildcard) cannot use any index. Therefore it will be slow. On tables with many rows, it is likely to be so slow it is useless.
- **RLIKE** (**REGEXP**) tends to be slower than **LIKE**, but has more capabilities.
- While MySQL offers **FULLTEXT** indexing on many types of table and column, those **FULLTEXT** indexes are *not* used to fulfill queries using **LIKE**.

Section 3.5: SELECT with CASE or IF

Query

```
SELECT st.name,  
       st.percentage,  
       CASE WHEN st.percentage >= 35 THEN 'Pass' ELSE 'Fail' END AS `Remark`  
FROM student AS st ;
```

Result

name	percentage	Remark
Isha	67	Pass
Rucha	28	Fail
Het	35	Pass
Ansh	92	Pass

Or with IF

```
SELECT st.name,  
       st.percentage,  
       IF(st.percentage >= 35, 'Pass', 'Fail') AS `Remark`  
FROM student AS st ;
```

N.B

```
IF(st.percentage >= 35, 'Pass', 'Fail')
```

This means : IF st.percentage >= 35 is **TRUE** then return 'Pass' ELSE return 'Fail'

Section 3.6: SELECT with Alias (AS)

SQL aliases are used to temporarily rename a table or a column. They are generally used to improve readability.

Query

```
SELECT username AS val FROM stack;  
SELECT username val FROM stack;
```

(Note: AS is syntactically optional.)

Result

```
+-----+
| val   |
+-----+
| admin |
| stack |
+-----+
2 rows in set (0.00 sec)
```

Section 3.7: SELECT with a LIMIT clause

Query:

```
SELECT *
FROM Customers
ORDER BY CustomerID
LIMIT 3;
```

Result:

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
1	Alfreds Futterkiste	Maria Anders	Obere Str. 57	Berlin	12209	Germany
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Avda. de la Constitución 2222	México D.F.	05021	Mexico
3	Antonio Moreno Taquería	Antonio Moreno	Mataderos 2312	México D.F.	05023	Mexico

Best Practice Always use **ORDER BY** when using **LIMIT**; otherwise the rows you will get will be unpredictable.

Query:

```
SELECT *
FROM Customers
ORDER BY CustomerID
LIMIT 2,1;
```

Explanation:

When a **LIMIT** clause contains two numbers, it is interpreted as **LIMIT offset, count**. So, in this example the query skips two records and returns one.

Result:

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
3	Antonio Moreno Taquería	Antonio Moreno	Mataderos 2312	México D.F.	05023	Mexico

Note:

The values in **LIMIT** clauses must be constants; they may not be column values.

Section 3.8: SELECT with BETWEEN

You can use BETWEEN clause to replace a combination of "greater than equal AND less than equal" conditions.

Data

```
+----+-----+
| id | username |
+----+-----+
|  1 | admin    |
|  2 | root     |
|  3 | toor     |
|  4 | mysql    |
|  5 | thanks   |
|  6 | java     |
+----+-----+
```

Query with operators

```
SELECT * FROM stack WHERE id >= 2 and id <= 5;
```

Similar query with BETWEEN

```
SELECT * FROM stack WHERE id BETWEEN 2 and 5;
```

Result

```
+----+-----+
| id | username |
+----+-----+
|  2 | root     |
|  3 | toor     |
|  4 | mysql    |
|  5 | thanks   |
+----+-----+
4 rows in set (0.00 sec)
```

Note

BETWEEN uses `>=` and `<=`, not `>` and `<`.

Using NOT BETWEEN

If you want to use the negative you can use **NOT**. For example :

```
SELECT * FROM stack WHERE id NOT BETWEEN 2 and 5;
```

Result

```
+----+-----+
| id | username |
+----+-----+
|  1 | admin    |
|  6 | java     |
+----+-----+
2 rows in set (0.00 sec)
```

Note

NOT BETWEEN uses **>** and **<** and **not >=** and **<=** That is, **WHERE** id **NOT BETWEEN** 2 **and** 5 is the same as **WHERE** (id < 2 **OR** id > 5).

If you have an index on a column you use in a **BETWEEN** search, MySQL can use that index for a range scan.

Section 3.9: SELECT with WHERE

Query

```
SELECT * FROM stack WHERE username = "admin" AND password = "admin";
```

Result

```
+-----+-----+-----+
| id   | username | password |
+-----+-----+-----+
| 1    | admin    | admin    |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Query with a nested SELECT in the WHERE clause

The **WHERE** clause can contain any valid **SELECT** statement to write more complex queries. This is a 'nested' query

Query

Nested queries are usually used to return single atomic values from queries for comparisons.

```
SELECT title FROM books WHERE author_id = (SELECT id FROM authors WHERE last_name = 'Bar' AND first_name = 'Foo');
```

Selects all usernames with no email address

```
SELECT * FROM stack WHERE username IN (SELECT username FROM signups WHERE email IS NULL);
```

Disclaimer: Consider using [joins](#) for performance improvements when comparing a whole result set.

Section 3.10: SELECT with LIKE(_)

A **_** character in a **LIKE** clause pattern matches a single character.

Query

```
SELECT username FROM users WHERE users LIKE 'admin_';
```

Result

```
+-----+
| username |
+-----+
| admin1   |
| admin2   |
| admin-   |
| adminA   |
+-----+
```

Section 3.11: SELECT with date range

```
SELECT ... WHERE dt >= '2017-02-01'  
            AND dt < '2017-02-01' + INTERVAL 1 MONTH
```

Sure, this could be done with **BETWEEN** and inclusion of `23:59:59`. But, the pattern has this benefits:

- You don't have pre-calculate the end date (which is often an exact length from the start)
- You don't include both endpoints (as **BETWEEN** does), nor type '23:59:59' to avoid it.
- It works for **DATE**, **TIMESTAMP**, **DATETIME**, and even the microsecond-included **DATETIME(6)**.
- It takes care of leap days, end of year, etc.
- It is index-friendly (so is **BETWEEN**).

Chapter 4: Backticks

Section 4.1: Backticks usage

There are many examples where backticks are used inside a query but for many it's still unclear when or where to use backticks ``.

Backticks are mainly used to prevent an error called "*MySQL reserved word*". When making a table in PHPmyAdmin you are sometimes faced with a warning or alert that you are using a "*MySQL reserved word*".

For example when you create a table with a column named "group" you get a warning. This is because you can make the following query:

```
SELECT student_name, AVG(test_score) FROM student GROUP BY group
```

To make sure you don't get an error in your query you have to use backticks so your query becomes:

```
SELECT student_name, AVG(test_score) FROM student GROUP BY `group`
```

Table

Not only column names can be surrounded by backticks, but also table names. For example when you need to JOIN multiple tables.

```
SELECT `users`.`username`, `groups`.`group` FROM `users`
```

Easier to read

As you can see using backticks around table and column names also make the query easier to read.

For example when you are used to write queries all in lower case:

```
select student_name, AVG(test_score) from student group by group
select `student_name`, AVG(`test_score`) from `student` group by `group`
```

Please see the MySQL Manual page entitled [Keywords and Reserved Words](#). The ones with an (R) are Reserved Words. The others are merely Keywords. The Reserved require special caution.

Chapter 5: NULL

Section 5.1: Uses for NULL

- Data not yet known - such as `end_date`, `rating`
- Optional data - such as `middle_initial` (though that might be better as the empty string)
- 0/0 - The result of certain computations, such as zero divided by zero.
- NULL is not equal to "" (blank string) or 0 (in case of integer).
- others?

Section 5.2: Testing NULLs

- `IS NULL` / `IS NOT NULL` -- `= NULL` does not work like you expect.
- `x <=> y` is a "null-safe" comparison.

In a `LEFT JOIN` tests for rows of a for which there is *not* a corresponding row in b.

```
SELECT ...  
FROM a  
LEFT JOIN b ON ...  
WHERE b.id IS NULL
```

Chapter 6: Limit and Offset

Section 6.1: Limit and Offset relationship

Considering the following users table:

id username

```
1 User1
2 User2
3 User3
4 User4
5 User5
```

In order to constrain the number of rows in the result set of a [SELECT query](#), the **LIMIT** clause can be used together with one or two positive integers as arguments (zero included).

LIMIT clause with one argument

When one argument is used, the result set will only be constrained to the number specified in the following manner:

```
SELECT * FROM users ORDER BY id ASC LIMIT 2
```

id username

```
1 User1
2 User2
```

If the argument's value is 0, the result set will be empty.

Also notice that the **ORDER BY** clause may be important in order to specify the first rows of the result set that will be presented (when ordering by another column).

LIMIT clause with two arguments

When two arguments are used in a **LIMIT** clause:

- the **first** argument represents the row from which the result set rows will be presented – this number is often mentioned as an **offset**, since it represents the row previous to the initial row of the constrained result set. This allows the argument to receive 0 as value and thus taking into consideration the first row of the non-constrained result set.
- the **second** argument specifies the maximum number of rows to be returned in the result set (similarly to the one argument's example).

Therefore the query:

```
SELECT * FROM users ORDER BY id ASC LIMIT 2, 3
```

Presents the following result set:

id username

```
3 User3
4 User4
5 User5
```

Notice that when the **offset** argument is 0, the result set will be equivalent to a one argument **LIMIT** clause. This

means that the following 2 queries:

```
SELECT * FROM users ORDER BY id ASC LIMIT 0, 2
```

```
SELECT * FROM users ORDER BY id ASC LIMIT 2
```

Produce the same result set:

id username

1 User1

2 User2

OFFSET keyword: alternative syntax

An alternative syntax for the **LIMIT** clause with two arguments consists in the usage of the **OFFSET** keyword after the first argument in the following manner:

```
SELECT * FROM users ORDER BY id ASC LIMIT 2 OFFSET 3
```

This query would return the following result set:

id username

3 User3

4 User4

Notice that in this alternative syntax the arguments have their positions switched:

- the **first** argument represents the number of rows to be returned in the result set;
- the **second** argument represents the offset.

Chapter 7: Creating databases

Parameter	Details
CREATE DATABASE	Creates a database with the given name
CREATE SCHEMA	This is a synonym for CREATE DATABASE
IF NOT EXISTS	Used to avoid execution error, if specified database already exists
create_specification	create_specification options specify database characteristics such as CHARACTER SET and COLLATE (database collation)

Section 7.1: Create database, users, and grants

Create a DATABASE. Note that the shortened word SCHEMA can be used as a synonym.

```
CREATE DATABASE Baseball; -- creates a database named Baseball
```

If the database already exists, Error 1007 is returned. To get around this error, try:

```
CREATE DATABASE IF NOT EXISTS Baseball;
```

Similarly,

```
DROP DATABASE IF EXISTS Baseball; -- Drops a database if it exists, avoids Error 1008  
DROP DATABASE xyz; -- If xyz does not exist, ERROR 1008 will occur
```

Due to the above Error possibilities, DDL statements are often used with **IF EXISTS**.

One can create a database with a default CHARACTER SET and collation. For example:

```
CREATE DATABASE Baseball CHARACTER SET utf8 COLLATE utf8_general_ci;  
SHOW CREATE DATABASE Baseball;
```

```
+-----+-----+  
| Database | Create Database |  
+-----+-----+  
| Baseball | CREATE DATABASE `Baseball` /*!40100 DEFAULT CHARACTER SET utf8 */ |  
+-----+-----+
```

See your current databases:

```
SHOW DATABASES;
```

```
+-----+  
| Database |  
+-----+  
| information_schema |  
| ajax_stuff |  
| Baseball |  
+-----+
```

Set the currently active database, and see some information:

```
USE Baseball; -- set it as the current database
```

```
SELECT @@character_set_database as cset, @@collation_database as col;
```

```
+-----+-----+
| cset | col |
+-----+-----+
| utf8 | utf8_general_ci |
+-----+-----+
```

The above shows the default CHARACTER SET and Collation for the database.

Create a user:

```
CREATE USER 'John123'@'%' IDENTIFIED BY 'OpenSesame';
```

The above creates a user John123, able to connect with any hostname due to the % wildcard. The Password for the user is set to 'OpenSesame' which is hashed.

And create another:

```
CREATE USER 'John456'@'%' IDENTIFIED BY 'somePassword';
```

Show that the users have been created by examining the special mysql database:

```
SELECT user, host, password from mysql.user where user in ('John123', 'John456');
```

```
+-----+-----+-----+
| user | host | password |
+-----+-----+-----+
| John123 | % | *E6531C342ED87 ..... |
| John456 | % | *B04E11FAAAE9A ..... |
+-----+-----+-----+
```

Note that at this point, the users have been created, but without any permissions to use the Baseball database.

Work with permissions for users and databases. Grant rights to user John123 to have full privileges on the Baseball database, and just SELECT rights for the other user:

```
GRANT ALL ON Baseball.* TO 'John123'@'%';
GRANT SELECT ON Baseball.* TO 'John456'@'%';
```

Verify the above:

```
SHOW GRANTS FOR 'John123'@'%';
```

```
+-----+
-----+
| Grants for John123@% |
|                       |
+-----+
-----+
| GRANT USAGE ON *.* TO 'John123'@'%' IDENTIFIED BY PASSWORD '*E6531C342ED87 ..... |
| GRANT ALL PRIVILEGES ON `baseball`.* TO 'John123'@'%' |
| |
+-----+
-----+
```

```
SHOW GRANTS FOR 'John456'@'%' ;
```

```
+-----+
+-----+
| Grants for John456@%
|
+-----+
+-----+
| GRANT USAGE ON *.* TO 'John456'@'%' IDENTIFIED BY PASSWORD '*B04E11FAAAE9A .....
|
| GRANT SELECT ON `baseball`.* TO 'John456'@'%'
|
+-----+
+-----+
```

Note that the **GRANT USAGE** that you will always see means simply that the user may login. That is all that that means.

Section 7.2: Creating and Selecting a Database

If the administrator creates your database for you when setting up your permissions, you can begin using it. Otherwise, you need to create it yourself:

```
mysql> CREATE DATABASE menagerie;
```

Under Unix, database names are case sensitive (unlike SQL keywords), so you must always refer to your database as `menagerie`, not as `Menagerie`, `MENAGERIE`, or some other variant. This is also true for table names. (Under Windows, this restriction does not apply, although you must refer to databases and tables using the same lettercase throughout a given query. However, for a variety of reasons, the recommended best practice is always to use the same lettercase that was used when the database was created.)

Creating a database does not select it for use; you must do that explicitly. To make `menagerie` the current database, use this statement:

```
mysql> USE menagerie
Database changed
```

Your database needs to be created only once, but you must select it for use each time you begin a `mysql` session. You can do this by issuing a `USE` statement as shown in the example. Alternatively, you can select the database on the command line when you invoke `mysql`. Just specify its name after any connection parameters that you might need to provide. For example:

```
shell> mysql -h host -u user -p menagerie
Enter password: ****
```

Section 7.3: MyDatabase

You *must* create your own database, and not use write to any of the existing databases. This is likely to be one of the very first things to do after getting connected the first time.

```
CREATE DATABASE my_db;
USE my_db;
CREATE TABLE some_table;
```

```
INSERT INTO some_table ...;
```

You can reference your table by qualifying with the database name: `my_db.some_table`.

Section 7.4: System Databases

The following databases exist for MySQL's use. You may read (**SELECT**) them, but you must not write (**INSERT/UPDATE/DELETE**) the tables in them. (There are a few exceptions.)

- `mysql` -- repository for **GRANT** info and some other things.
- `information_schema` -- The tables here are 'virtual' in the sense that they are actually manifested by in-memory structures. Their contents include the schema for all tables.
- `performance_schema` -- ?? [please accept, then edit]
- others?? (for MariaDB, Galera, TokuDB, etc)

Chapter 8: Using Variables

Section 8.1: Setting Variables

Here are some ways to set variables:

1. You can set a variable to a specific, string, number, date using SET

```
SET @var_string = 'my_var';
SET @var_num = '2';
SET @var_date = '2015-07-20';
```

2. you can set a variable to be the result of a select statement using :=

```
Select @var := '123';
```

(Note: You need to use := when assigning a variable not using the SET syntax, because in other statements, (select, update...) the "=" is used to compare, so when you add a colon before the "=", you are saying "This is not a comparison, this is a SET".)

3. You can set a variable to be the result of a select statement using INTO

(This was particularly helpful when I needed to dynamically choose which Partitions to query from)

```
SET @start_date = '2015-07-20';
SET @end_date = '2016-01-31';

#this gets the year month value to use as the partition names
SET @start_yearmonth = (SELECT EXTRACT(YEAR_MONTH FROM @start_date));
SET @end_yearmonth = (SELECT EXTRACT(YEAR_MONTH FROM @end_date));

#put the partitions into a variable
SELECT GROUP_CONCAT(partition_name)
FROM information_schema.partitions p
WHERE table_name = 'partitioned_table'
AND SUBSTRING_INDEX(partition_name, 'P', -1) BETWEEN @start_yearmonth AND @end_yearmonth
INTO @partitions;

#put the query in a variable. You need to do this, because mysql did not recognize my variable as a
variable in that position. You need to concat the value of the variable together with the rest of the
query and then execute it as a stmt.
SET @query =
CONCAT('CREATE TABLE part_of_partitioned_table (PRIMARY KEY(id))
SELECT partitioned_table.*
FROM partitioned_table PARTITION(' , @partitions, ')
JOIN users u USING(user_id)
WHERE date(partitioned_table.date) BETWEEN ' , @start_date, ' AND ' , @end_date);

#prepare the statement from @query
PREPARE stmt FROM @query;
#drop table
DROP TABLE IF EXISTS tech.part_of_partitioned_table;
#create table using statement
EXECUTE stmt;
```

Section 8.2: Row Number and Group By using variables in Select Statement

Let's say we have a table team_person as below:

```
+=====+=====+
| team |    person |
+=====+=====+
|  A  |    John  |
+-----+-----+
|  B  |    Smith |
+-----+-----+
|  A  |   Walter |
+-----+-----+
|  A  |    Louis |
+-----+-----+
|  C  | Elizabeth |
+-----+-----+
|  B  |    Wayne |
+-----+-----+
```

```
CREATE TABLE team_person AS SELECT 'A' team, 'John' person
UNION ALL SELECT 'B' team, 'Smith' person
UNION ALL SELECT 'A' team, 'Walter' person
UNION ALL SELECT 'A' team, 'Louis' person
UNION ALL SELECT 'C' team, 'Elizabeth' person
UNION ALL SELECT 'B' team, 'Wayne' person;
```

To select the table team_person with additional row_number column, either

```
SELECT @row_no := @row_no+1 AS row_number, team, person
FROM team_person, (SELECT @row_no := 0) t;
```

OR

```
SET @row_no := 0;
SELECT @row_no := @row_no + 1 AS row_number, team, person
FROM team_person;
```

will output the result below:

```
+=====+=====+=====+
| row_number | team |    person |
+=====+=====+=====+
|          1 |  A  |    John  |
+-----+-----+-----+
|          2 |  B  |    Smith |
+-----+-----+-----+
|          3 |  A  |   Walter |
+-----+-----+-----+
|          4 |  A  |    Louis |
+-----+-----+-----+
|          5 |  C  | Elizabeth |
+-----+-----+-----+
|          6 |  B  |    Wayne |
+-----+-----+-----+
```

Finally, if we want to get the row_number group by column team

```
SELECT @row_no := IF(@prev_val = t.team, @row_no + 1, 1) AS row_number
      ,@prev_val := t.team AS team
      ,t.person
FROM team_person t,
     (SELECT @row_no := 0) x,
     (SELECT @prev_val := '') y
ORDER BY t.team ASC,t.person DESC;
```

row_number	team	person
1	A	Walter
2	A	Louis
3	A	John
1	B	Wayne
2	B	Smith
1	C	Elizabeth

Chapter 9: Comment MySQL

Section 9.1: Adding comments

There are three types of comment:

```
# This comment continues to the end of line

-- This comment continues to the end of line

/* This is an in-line comment */

/*
This is a
multiple-line comment
*/
```

Example:

```
SELECT * FROM t1; -- this is comment

CREATE TABLE stack(
    /*id_user int,
    username varchar(30),
    password varchar(30)
    */
    id int
);
```

The `--` method requires that a space follows the `--` before the comment begins, otherwise it will be interpreted as a command and usually cause an error.

```
#This comment works
/*This comment works.*/
--This comment does not.
```

Section 9.2: Commenting table definitions

```
CREATE TABLE menagerie.bird (
    bird_id INT NOT NULL AUTO_INCREMENT,
    species VARCHAR(300) DEFAULT NULL COMMENT 'You can include genus, but never subspecies.',
    INDEX idx_species (species) COMMENT 'We must search on species often.',
    PRIMARY KEY (bird_id)
) ENGINE=InnoDB COMMENT 'This table was inaugurated on February 10th.';
```

Using an `=` after **COMMENT** is optional. ([Official docs](#))

These comments, unlike the others, are saved with the schema and can be retrieved via **SHOW CREATE TABLE** or from `information_schema`.

Chapter 10: INSERT

Section 10.1: INSERT, ON DUPLICATE KEY UPDATE

```
INSERT INTO `table_name`  
  (`index_field`, `other_field_1`, `other_field_2`)  
VALUES  
  ('index_value', 'insert_value', 'other_value')  
ON DUPLICATE KEY UPDATE  
  `other_field_1` = 'update_value',  
  `other_field_2` = VALUES(`other_field_2`);
```

This will **INSERT** into `table_name` the specified values, but if the unique key already exists, it will update the `other_field_1` to have a new value.

Sometimes, when updating on duplicate key it comes in handy to use **VALUES()** in order to access the original value that was passed to the **INSERT** instead of setting the value directly. This way, you can set different values by using **INSERT** and **UPDATE**. See the example above where `other_field_1` is set to `insert_value` on **INSERT** or to `update_value` on **UPDATE** while `other_field_2` is always set to `other_value`.

Crucial for the Insert on Duplicate Key Update (IODKU) to work is the schema containing a unique key that will signal a duplicate clash. This unique key can be a Primary Key or not. It can be a unique key on a single column, or a multi-column (composite key).

Section 10.2: Inserting multiple rows

```
INSERT INTO `my_table` (`field_1`, `field_2`) VALUES  
  ('data_1', 'data_2'),  
  ('data_1', 'data_3'),  
  ('data_4', 'data_5');
```

This is an easy way to add several rows at once with one **INSERT** statement.

This kind of 'batch' insert is much faster than inserting rows one by one. Typically, inserting 100 rows in a single batch insert this way is 10 times as fast as inserting them all individually.

Ignoring existing rows

When importing large datasets, it may be preferable under certain circumstances to skip rows that would usually cause the query to fail due to a column restraint e.g. duplicate primary keys. This can be done using **INSERT IGNORE**.

Consider following example database:

```
SELECT * FROM `people`;  
--- Produces:  
+-----+  
| id | name |  
+-----+  
| 1 | john |  
| 2 | anna |  
+-----+
```

```
INSERT IGNORE INTO `people` (`id`, `name`) VALUES  
  ('2', 'anna'), --- Without the IGNORE keyword, this record would produce an error  
  ('3', 'mike');
```

```
SELECT * FROM `people`;
--- Produces:
+-----+-----+
| id | name |
+-----+-----+
| 1 | john |
| 2 | anna |
| 3 | mike |
+-----+-----+
```

The important thing to remember is that *INSERT IGNORE* will also silently skip other errors too, here is what Mysql official documentations says:

Data conversions that would trigger errors abort the statement if IGNORE is not > specified. With IGNORE, invalid values are adjusted to the closest values and >inserted; warnings are produced but the statement does not abort.

Note: The section below is added for the sake of completeness, but is not considered best practice (this would fail, for example, if another column was added into the table).

If you specify the value of the corresponding column for all columns in the table, you can ignore the column list in the **INSERT** statement as follows:

```
INSERT INTO `my_table` VALUES
  ('data_1', 'data_2'),
  ('data_1', 'data_3'),
  ('data_4', 'data_5');
```

Section 10.3: Basic Insert

```
INSERT INTO `table_name` (`field_one`, `field_two`) VALUES ('value_one', 'value_two');
```

In this trivial example, `table_name` is where the data are to be added, `field_one` and `field_two` are fields to set data against, and `value_one` and `value_two` are the data to do against `field_one` and `field_two` respectively.

It's good practice to list the fields you are inserting data into within your code, as if the table changes and new columns are added, your insert would break should they not be there

Section 10.4: INSERT with AUTO_INCREMENT + LAST_INSERT_ID()

When a table has an **AUTO_INCREMENT PRIMARY KEY**, normally one does not insert into that column. Instead, specify all the other columns, then ask what the new id was.

```
CREATE TABLE t (
  id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL,
  this ...,
  that ...,
  PRIMARY KEY(id) );

INSERT INTO t (this, that) VALUES (... , ...);
SELECT LAST_INSERT_ID() INTO @id;
INSERT INTO another_table (... , t_id, ...) VALUES (... , @id, ...);
```

Note that `LAST_INSERT_ID()` is tied to the session, so even if multiple connections are inserting into the same table, each will get its own id.

Your client API probably has an alternative way of getting the `LAST_INSERT_ID()` without actually performing a `SELECT` and handing the value back to the client instead of leaving it in an `@variable` inside MySQL. Such is usually preferable.

Longer, more detailed, example

The "normal" usage of IODKU is to trigger "duplicate key" based on some `UNIQUE` key, not the `AUTO_INCREMENT PRIMARY KEY`. The following demonstrates such. Note that it does *not* supply the id in the INSERT.

Setup for examples to follow:

```
CREATE TABLE iodku (  
  id INT AUTO_INCREMENT NOT NULL,  
  name VARCHAR(99) NOT NULL,  
  misc INT NOT NULL,  
  PRIMARY KEY(id),  
  UNIQUE(name)  
) ENGINE=InnoDB;
```

```
INSERT INTO iodku (name, misc)  
VALUES  
('Leslie', 123),  
('Sally', 456);
```

Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

```
+-----+-----+-----+  
| id | name  | misc |  
+-----+-----+-----+  
| 1 | Leslie | 123 |  
| 2 | Sally  | 456 |  
+-----+-----+-----+
```

The case of IODKU performing an "update" and `LAST_INSERT_ID()` retrieving the relevant id:

```
INSERT INTO iodku (name, misc)  
VALUES  
('Sally', 3333)           -- should update  
ON DUPLICATE KEY UPDATE  -- `name` will trigger "duplicate key"  
  id = LAST_INSERT_ID(id),  
  misc = VALUES(misc);  
SELECT LAST_INSERT_ID();   -- picking up existing value
```

```
+-----+  
| LAST_INSERT_ID() |  
+-----+  
| 2 |  
+-----+
```

The case where IODKU performs an "insert" and `LAST_INSERT_ID()` retrieves the new id:

```
INSERT INTO iodku (name, misc)  
VALUES  
('Dana', 789)           -- Should insert
```

```

ON DUPLICATE KEY UPDATE
  id = LAST_INSERT_ID(id),
  misc = VALUES(misc);
SELECT LAST_INSERT_ID();  -- picking up new value

```

```

+-----+
| LAST_INSERT_ID() |
+-----+
|                3 |
+-----+

```

Resulting table contents:

```

SELECT * FROM iodku;

```

```

+----+-----+-----+
| id | name  | misc |
+----+-----+-----+
| 1  | Leslie | 123  |
| 2  | Sally  | 3333 | -- IODKU changed this
| 3  | Dana   | 789  | -- IODKU added this
+----+-----+-----+

```

Section 10.5: INSERT SELECT (Inserting data from another Table)

This is the basic way to insert data from another table with the SELECT statement.

```

INSERT INTO `tableA` (`field_one`, `field_two`)
SELECT `tableB`.`field_one`, `tableB`.`field_two`
FROM `tableB`
WHERE `tableB`.clmn <> 'someValue'
ORDER BY `tableB`.`sorting_clmn`;

```

You can **SELECT * FROM**, but then tableA and tableB *must* have matching column count and corresponding datatypes.

Columns with **AUTO_INCREMENT** are treated as in the **INSERT** with **VALUES** clause.

This syntax makes it easy to fill (temporary) tables with data from other tables, even more so when the data is to be filtered on the insert.

Section 10.6: Lost AUTO_INCREMENT ids

Several 'insert' functions can "burn" ids. Here is an example, using InnoDB (other Engines may work differently):

```

CREATE TABLE Burn (
  id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL,
  name VARCHAR(99) NOT NULL,
  PRIMARY KEY(id),
  UNIQUE(name)
) ENGINE=InnoDB;

INSERT IGNORE INTO Burn (name) VALUES ('first'), ('second');
SELECT LAST_INSERT_ID();           -- 1
SELECT * FROM Burn ORDER BY id;

```

```
+-----+
| 1 | first |
| 2 | second |
+-----+
```

```
INSERT IGNORE INTO Burn (name) VALUES ('second'); -- dup 'IGNOREd', but id=3 is burned
SELECT LAST_INSERT_ID(); -- Still "1" -- can't trust in this situation
SELECT * FROM Burn ORDER BY id;
```

```
+-----+
| 1 | first |
| 2 | second |
+-----+
```

```
INSERT IGNORE INTO Burn (name) VALUES ('third');
SELECT LAST_INSERT_ID(); -- now "4"
SELECT * FROM Burn ORDER BY id; -- note that id=3 was skipped over
```

```
+-----+
| 1 | first |
| 2 | second |
| 4 | third | -- notice that id=3 has been 'burned'
+-----+
```

Think of it (roughly) this way: First the insert looks to see how many rows *might* be inserted. Then grab that many values from the auto_increment for that table. Finally, insert the rows, using ids as needed, and burning any left overs.

The only time the leftover are recoverable is if the system is shutdown and restarted. On restart, effectively `MAX(id)` is performed. This may reuse ids that were burned or that were freed up by `DELETE`s of the highest id(s).

Essentially any flavor of `INSERT` (including `REPLACE`, which is `DELETE + INSERT`) can burn ids. In InnoDB, the global (not session!) variable `innodb_autoinc_lock_mode` can be used to control some of what is going on.

When "normalizing" long strings into an `AUTO INCREMENT` id, burning can easily happen. This *could* lead to overflowing the size of the `INT` you chose.

Chapter 11: DELETE

Parameter	Details
LOW_PRIORITY	If LOW_PRIORITY is provided, the delete will be delayed until there are no processes reading from the table
IGNORE	If IGNORE is provided, all errors encountered during the delete are ignored
table	The table from which you are going to delete records
WHERE conditions	The conditions that must be met for the records to be deleted. If no conditions are provided, then all records from the table will be deleted
ORDER BY expression	If ORDER BY is provided, records will be deleted in the given order
LIMIT	It controls the maximum number of records to delete from the table. Given number_rows will be deleted.

Section 11.1: Multi-Table Deletes

MySQL's **DELETE** statement can use the **JOIN** construct, allowing also to specify which tables to delete from. This is useful to avoid nested queries. Given the schema:

```
create table people
(
  id int primary key,
  name varchar(100) not null,
  gender char(1) not null
);
insert people (id,name,gender) values
(1,'Kathy','f'),(2,'John','m'),(3,'Paul','m'),(4,'Kim','f');

create table pets
(
  id int auto_increment primary key,
  ownerId int not null,
  name varchar(100) not null,
  color varchar(100) not null
);
insert pets(ownerId,name,color) values
(1,'Rover','beige'),(2,'Bubbles','purple'),(3,'Spot','black and white'),
(1,'Rover2','white');
```

id name gender

```
1 Kathy f
2 John m
3 Paul m
4 Kim f
```

id ownerId name color

```
1 1 Rover beige
2 2 Bubbles purple
4 1 Rover2 white
```

If we want to remove Paul's pets, the statement

```
DELETE p2
FROM pets p2
WHERE p2.ownerId in (
  SELECT p1.id
  FROM people p1
  WHERE p1.name = 'Paul');
```

can be rewritten as:

```
DELETE p2      -- remove only rows from pets
FROM people p1
JOIN pets p2
ON p2.ownerId = p1.id
WHERE p1.name = 'Paul';
```

1 row deleted

Spot is deleted from Pets

p1 and p2 are aliases for the table names, especially useful for long table names and ease of readability.

To remove both the person and the pet:

```
DELETE p1, p2      -- remove rows from both tables
FROM people p1
JOIN pets p2
ON p2.ownerId = p1.id
WHERE p1.name = 'Paul';
```

2 rows deleted

Spot is deleted from Pets

Paul is deleted from People

foreign keys

When the DELETE statement involves tables with a foreign key constraint the optimizer may process the tables in an order that does not follow the relationship. Adding for example a foreign key to the definition of pets

```
ALTER TABLE pets ADD CONSTRAINT `fk_pets_2_people` FOREIGN KEY (ownerId) REFERENCES people(id) ON
DELETE CASCADE;
```

the engine may try to delete the entries from people before pets, thus causing the following error:

```
ERROR 1451 (23000): Cannot delete or update a parent row: a foreign key constraint fails
(`test`.`pets`, CONSTRAINT `pets_ibfk_1` FOREIGN KEY (`ownerId`) REFERENCES `people` (`id`))
```

The solution in this case is to delete the row from people and rely on InnoDB's ON DELETE capabilities to propagate the deletion:

```
DELETE FROM people
WHERE name = 'Paul';
```

2 rows deleted

Paul is deleted from People

Spot is deleted on cascade from Pets

Another solution is to temporarily disable the check on foreign keys:

```
SET foreign_key_checks = 0;
DELETE p1, p2 FROM people p1 JOIN pets p2 ON p2.ownerId = p1.id WHERE p1.name = 'Paul';
SET foreign_key_checks = 1;
```

Section 11.2: DELETE vs TRUNCATE

```
TRUNCATE tableName;
```

This will [delete](#) all the data and reset [AUTO_INCREMENT](#) index. It's much faster than **DELETE FROM** tableName on a huge dataset. It can be very useful during development/testing.

When you **truncate** a table SQL server doesn't delete the data, it drops the table and recreates it, thereby deallocating the pages so there is a chance to recover the truncated data before the pages were overwritten. (The space cannot immediately be recouped for innodb_file_per_table=OFF.)

Section 11.3: Multi-table DELETE

MySQL allows to specify from which table the matching rows must be deleted

```
-- remove only the employees
DELETE e
FROM Employees e JOIN Department d ON e.department_id = d.department_id
WHERE d.name = 'Sales'

-- remove employees and department
DELETE e, d
FROM Employees e JOIN Department d ON e.department_id = d.department_id
WHERE d.name = 'Sales'

-- remove from all tables (in this case same as previous)
DELETE
FROM Employees e JOIN Department d ON e.department_id = d.department_id
WHERE d.name = 'Sales'
```

Section 11.4: Basic delete

```
DELETE FROM `myTable` WHERE `someColumn` = 'something'
```

The **WHERE** clause is optional but without it all rows are deleted.

Section 11.5: Delete with Where clause

```
DELETE FROM `table_name` WHERE `field_one` = 'value_one'
```

This will delete all rows from the table where the contents of the field_one for that row match 'value_one'

The **WHERE** clause works in the same way as a select, so things like **>**, **<**, **<>** or **LIKE** can be used.

Notice: It is necessary to use conditional clauses (WHERE, LIKE) in delete query. If you do not use any conditional clauses then all data from that table will be deleted.

Section 11.6: Delete all rows from a table

```
DELETE FROM table_name ;
```

This will delete everything, all rows from the table. It is the most basic example of the syntax. It also shows that **DELETE** statements should really be used with extra care as they may empty a table, if the **WHERE** clause is omitted.

Section 11.7: LIMITing deletes

```
DELETE FROM `table_name` WHERE `field_one` = 'value_one' LIMIT 1
```

This works in the same way as the 'Delete with Where clause' example, but it will stop the deletion once the limited

number of rows have been removed.

If you are limiting rows for deletion like this, be aware that it will delete the first row which matches the criteria. It might not be the one you would expect, as the results can come back unsorted if they are not explicitly ordered.

Chapter 12: UPDATE

Section 12.1: Update with Join Pattern

Consider a production table called `questions_mysql` and a table `iwtQuestions` (imported worktable) representing the last batch of imported CSV data from a [LOAD DATA INFILE](#). The worktable is truncated before the import, the data is imported, and that process is not shown here.

Update our production data using a join to our imported worktable data.

```
UPDATE questions_mysql q -- our real table for production
JOIN iwtQuestions i -- imported worktable
ON i.qId = q.qId
SET q.closeVotes = i.closeVotes,
    q.votes = i.votes,
    q.answers = i.answers,
    q.views = i.views;
```

Aliases `q` and `i` are used to abbreviate the table references. This eases development and readability.

`qId`, the Primary Key, represents the Stackoverflow question id. Four columns are updated for matching rows from the join.

Section 12.2: Basic Update

Updating one row

```
UPDATE customers SET email='luke_smith@email.com' WHERE id=1
```

This query updates the content of `email` in the `customers` table to the string `luke_smith@email.com` where the value of `id` is equal to 1. The old and new contents of the database table are illustrated below on the left and right respectively:

customers			
id	firstname	lastname	email
1	Luke	Smith	luke@example.com
2	Anna	Carey	anna@example.com
3	Todd	Winters	todd@example.com

customers			
id	firstname	lastname	email
1	Luke	Smith	luke_smith@email.com
2	Anna	Carey	anna@example.com
3	Todd	Winters	todd@example.com

Updating all rows

```
UPDATE customers SET lastname='smith'
```

This query update the content of `lastname` for every entry in the `customers` table. The old and new contents of the database table are illustrated below on the left and right respectively:

customers			
id	firstname	lastname	email
1	Luke	Smith	luke@example.com
2	Anna	Carey	anna@example.com
3	Todd	Winters	todd@example.com

customers			
id	firstname	lastname	email
1	Luke	Smith	luke@example.com
2	Anna	Smith	anna@example.com
3	Todd	Smith	todd@example.com

Notice: It is necessary to use conditional clauses (WHERE) in UPDATE query. If you do not use any conditional clause then all records of that table's attribute will be updated. In above example new value (Smith) of lastname in

customers table set to all rows.

Section 12.3: Bulk UPDATE

When updating multiple rows with different values it is much quicker to use a bulk update.

```
UPDATE people
SET name =
    (CASE id WHEN 1 THEN 'Karl'
          WHEN 2 THEN 'Tom'
          WHEN 3 THEN 'Mary'
        END)
WHERE id IN (1,2,3);
```

By bulk updating only one query can be sent to the server instead of one query for each row to update. The cases should contain all possible parameters looked up in the **WHERE** clause.

Section 12.4: UPDATE with ORDER BY and LIMIT

If the **ORDER BY** clause is specified in your update SQL statement, the rows are updated in the order that is specified.

If **LIMIT** clause is specified in your SQL statement, that places a limit on the number of rows that can be updated. There is no limit, if **LIMIT** clause not specified.

ORDER BY and **LIMIT** cannot be used for multi table update.

Syntax for the MySQL **UPDATE** with **ORDER BY** and **LIMIT** is,

```
UPDATE [ LOW_PRIORITY ] [ IGNORE ]
tableName
SET column1 = expression1,
    column2 = expression2,
    ...
[WHERE conditions]
[ORDER BY expression [ ASC | DESC ]]
[LIMIT row_count];

---> Example
UPDATE employees SET isConfirmed=1 ORDER BY joiningDate LIMIT 10
```

In the above example, 10 rows will be updated according to the order of employees joiningDate.

Section 12.5: Multiple Table UPDATE

In multiple table **UPDATE**, it updates rows in each specified tables that satisfy the conditions. Each matching row is updated once, even if it matches the conditions multiple times.

In multiple table **UPDATE**, **ORDER BY** and **LIMIT** cannot be used.

Syntax for multi table **UPDATE** is,

```
UPDATE [LOW_PRIORITY] [IGNORE]
table1, table2, ...
SET column1 = expression1,
    column2 = expression2,
    ...
```

[WHERE conditions]

For example consider two tables, products and salesOrders. In case, we decrease the quantity of a particular product from the sales order which is placed already. Then we also need to increase that quantity in our stock column of products table. This can be done in single SQL update statement like below.

```
UPDATE products, salesOrders
  SET salesOrders.Quantity = salesOrders.Quantity - 5,
      products.availableStock = products.availableStock + 5
 WHERE products.productId = salesOrders.productId
  AND salesOrders.orderId = 100 AND salesOrders.productId = 20;
```

In the above example, quantity '5' will be reduced from the salesOrders table and the same will be increased in products table according to the WHERE conditions.

Chapter 13: ORDER BY

Section 13.1: Contexts

The clauses in a **SELECT** have a specific order:

```
SELECT ... FROM ... WHERE ... GROUP BY ... HAVING ...  
    ORDER BY ... -- goes here  
    LIMIT ... OFFSET ...;  
  
( SELECT ... ) UNION ( SELECT ... ) ORDER BY ... -- for ordering the result of the UNION.  
  
SELECT ... GROUP_CONCAT(DISTINCT x ORDER BY ... SEPARATOR ...) ...  
  
ALTER TABLE ... ORDER BY ... -- probably useful only for MyISAM; not for InnoDB
```

Section 13.2: Basic

ORDER BY x

x can be any datatype.

- NULLs precede non-NULLs.
- The default is **ASC** (lowest to highest)
- Strings (**VARCHAR**, etc) are ordered according the **COLLATION** of the declaration
- ENUMs are ordered by the declaration order of its strings.

Section 13.3: ASCending / DESCending

```
ORDER BY x ASC -- same as default  
ORDER BY x DESC -- highest to lowest  
ORDER BY lastname, firstname -- typical name sorting; using two columns  
ORDER BY submit_date DESC -- latest first  
ORDER BY submit_date DESC, id ASC -- latest first, but fully specifying order.
```

- **ASC** = ASCENDING, **DESC** = DESCENDING
- NULLs come first even for **DESC**.
- In the above examples, **INDEX(x)**, **INDEX(lastname, firstname)**, **INDEX(submit_date)** may significantly improve performance.

But... Mixing **ASC** and **DESC**, as in the last example, cannot use a composite index to benefit. Nor will **INDEX(submit_date DESC, id ASC)** help -- "**DESC**" is recognized syntactically in the **INDEX** declaration, but ignored.

Section 13.4: Some tricks

```
ORDER BY FIND_IN_SET(card_type, "MASTER-CARD,VISA,DISCOVER") -- sort 'MASTER-CARD' first.  
ORDER BY x IS NULL, x -- order by 'x', but put 'NULLs' last.
```

Custom ordering

```
SELECT * FROM some_table WHERE id IN (118, 17, 113, 23, 72)  
ORDER BY FIELD(id, 118, 17, 113, 23, 72);
```

Returns the result in the specified order of ids.

id ...
118 ...
17 ...
113 ...
23 ...
72 ...

Useful if the ids are already sorted and you just need to retrieve the rows.

Chapter 14: Group By

Parameter	DETAILS
expression1, expression2, ... expression_n	The expressions that are not encapsulated within an aggregate function and must be included in the GROUP BY clause.
aggregate_function	A function such as SUM, COUNT, MIN, MAX, or AVG functions.
tables	he tables that you wish to retrieve records from. There must be at least one table listed in the FROM clause.
WHERE conditions	Optional. The conditions that must be met for the records to be selected.

Section 14.1: GROUP BY using HAVING

```
SELECT department, COUNT(*) AS "Man_Power"  
FROM employees  
GROUP BY department  
HAVING COUNT(*) >= 10;
```

Using **GROUP BY** ... **HAVING** to filter aggregate records is analogous to using **SELECT** ... **WHERE** to filter individual records.

You could also say **HAVING** Man_Power >= 10 since **HAVING** understands "aliases".

Section 14.2: Group By using Group Concat

[Group Concat](#) is used in MySQL to get concatenated values of expressions with more than one result per column. Meaning, there are many rows to be selected back for one column such as Name(1):Score(*)

Name Score

Adam A+
Adam A-
Adam B
Adam C+
Bill D-
John A-

```
SELECT Name, GROUP_CONCAT(Score ORDER BY Score desc SEPARATOR ' ') AS Grades  
FROM Grade  
GROUP BY Name
```

Results:

```
+-----+-----+  
| Name | Grades      |  
+-----+-----+  
| Adam | C+ B A- A+ |  
| Bill | D-          |  
| John | A-          |  
+-----+-----+
```

Section 14.3: Group By Using MIN function

Assume a table of employees in which each row is an employee who has a name, a department, and a salary.

```
SELECT department, MIN(salary) AS "Lowest salary"  
FROM employees
```

```
GROUP BY department;
```

This would tell you which department contains the employee with the lowest salary, and what that salary is. Finding the name of the employee with the lowest salary in each department is a different problem, beyond the scope of this Example. See "groupwise max".

Section 14.4: GROUP BY with AGGREGATE functions

Table ORDERS

orderid	customerid	customer	total	items
1	1	Bob	1300	10
2	3	Fred	500	2
3	5	Tess	2500	8
4	1	Bob	300	6
5	2	Carly	800	3
6	2	Carly	1000	12
7	3	Fred	100	1
8	5	Tess	11500	50
9	4	Jenny	200	2
10	1	Bob	500	15

- COUNT

Return the **number of rows** that satisfy a specific criteria in **WHERE** clause.

E.g.: Number of orders for each customer.

```
SELECT customer, COUNT(*) as orders
FROM orders
GROUP BY customer
ORDER BY customer
```

Result:

customer	orders
Bob	3
Carly	2
Fred	2
Jenny	1
Tess	2

- SUM

Return the **sum** of the selected column.

E.g.: Sum of the total and items for each customer.

```
SELECT customer, SUM(total) as sum_total, SUM(items) as sum_items
FROM orders
```

```
GROUP BY customer
ORDER BY customer
```

Result:

customer	sum_total	sum_items
Bob	2100	31
Carly	1800	15
Fred	600	3
Jenny	200	2
Tess	14000	58

- **AVG**

Return the **average** value of a column of numeric value.

E.g.: Average order value for each customers.

```
SELECT customer, AVG(total) as avg_total
FROM orders
GROUP BY customer
ORDER BY customer
```

Result:

customer	avg_total
Bob	700
Carly	900
Fred	300
Jenny	200
Tess	7000

- **MAX**

Return the **highest** value of a certain column or expression.

E.g.: Highest order total for each customers.

```
SELECT customer, MAX(total) as max_total
FROM orders
GROUP BY customer
ORDER BY customer
```

Result:

customer	max_total
Bob	1300
Carly	1000

Fred		500	
Jenny		200	
Tess		11500	
+-----+-----+			

- **MIN**

Return the **lowest** value of a certain column or expression.

E.g.: Lowest order total for each customers.

```
SELECT customer, MIN(total) as min_total
FROM orders
GROUP BY customer
ORDER BY customer
```

Result:

+-----+-----+			
customer		min_total	
+-----+-----+			
Bob		300	
Carly		800	
Fred		100	
Jenny		200	
Tess		2500	
+-----+-----+			

Chapter 15: Error 1055: ONLY_FULL_GROUP_BY: something is not in GROUP BY clause ...

Recently, new versions of MySQL servers have begun to generate 1055 errors for queries that used to work. This topic explains those errors. The MySQL team has been working to retire the nonstandard extension to **GROUP BY**, or at least to make it harder for query writing developers to be burned by it.

Section 15.1: Misusing GROUP BY to return unpredictable results: Murphy's Law

```
SELECT item.item_id, uses.category,    /* nonstandard */
       COUNT(*) number_of_uses
FROM   item
JOIN   uses ON item.item_id, uses.item_id
GROUP BY item.item_id
```

will show the rows in a table called `item`, and show the count of related rows in a table called `uses`. It will also show the value of a column called `uses.category`.

This query works in MySQL (before the `ONLY_FULL_GROUP_BY` flag appeared). It uses [MySQL's nonstandard extension to GROUP BY](#).

But the query has a problem: if several rows in the `uses` table match the `ON` condition in the **JOIN** clause, MySQL returns the category column from just one of those rows. Which row? The writer of the query, and the user of the application, doesn't get to know that in advance. Formally speaking, it's *unpredictable*: MySQL can return any value it wants.

Unpredictable is like *random*, with one significant difference. One might expect a *random* choice to change from time to time. Therefore, if a choice were random, you might detect it during debugging or testing. The *unpredictable* result is worse: MySQL returns the same result each time you use the query, *until it doesn't*. Sometimes it's a new version of the MySQL server that causes a different result. Sometimes it's a growing table causing the problem. What can go wrong, will go wrong, and when you don't expect it. That's called [Murphy's Law](#).

The MySQL team has been working to make it harder for developers to make this mistake. Newer versions of MySQL in the 5.7 sequence have a `sql_mode` flag called `ONLY_FULL_GROUP_BY`. When that flag is set, the MySQL server returns the 1055 error and refuses to run this kind of query.

Section 15.2: Misusing GROUP BY with SELECT *, and how to fix it

Sometimes a query looks like this, with a `*` in the **SELECT** clause.

```
SELECT item.*,          /* nonstandard */
       COUNT(*) number_of_uses
FROM   item
JOIN   uses ON item.item_id, uses.item_id
GROUP BY item.item_id
```

Such a query needs to be refactored to comply with the `ONLY_FULL_GROUP_BY` standard.

To do this, we need a subquery that uses **GROUP BY** correctly to return the `number_of_uses` value for each `item_id`.

This subquery is short and sweet, because it only needs to look at the uses table.

```
SELECT item_id, COUNT(*) number_of_uses
FROM uses
GROUP BY item_id
```

Then, we can join that subquery with the item table.

```
SELECT item.*, usecount.number_of_uses
FROM item
JOIN (
    SELECT item_id, COUNT(*) number_of_uses
    FROM uses
    GROUP BY item_id
) usecount ON item.item_id = usecount.item_id
```

This allows the **GROUP BY** clause to be simple and correct, and also allows us to use the ***** specifier.

Note: nevertheless, wise developers avoid using the ***** specifier in any case. It's usually better to list the columns you want in a query.

Section 15.3: ANY_VALUE()

```
SELECT item.item_id, ANY_VALUE(uses.tag) tag,
       COUNT(*) number_of_uses
FROM item
JOIN uses ON item.item_id, uses.item_id
GROUP BY item.item_id
```

shows the rows in a table called `item`, the count of related rows, and one of the values in the related table called `uses`.

You can think of [this ANY_VALUE\(\) function](#) as a strange kind of aggregate function. Instead of returning a count, sum, or maximum, it instructs the MySQL server to choose, arbitrarily, one value from the group in question. It's a way of working around Error 1055.

Be careful when using `ANY_VALUE()` in queries in production applications.

It really should be called `SURPRISE_ME()`. It returns the value of some row in the `GROUP BY` group. Which row it returns is indeterminate. That means it's entirely up to the MySQL server. Formally, it returns an unpredictable value.

The server doesn't choose a random value, it's worse than that. It returns the same value every time you run the query, until it doesn't. It can change, or not, when a table grows or shrinks, or when the server has more or less RAM, or when the server version changes, or when Mars is in retrograde (whatever that means), or for no reason at all.

You have been warned.

Section 15.4: Using and misusing GROUP BY

```
SELECT item.item_id, item.name,      /* not SQL-92 */
       COUNT(*) number_of_uses
FROM item
JOIN uses ON item.item_id, uses.item_id
```

```
GROUP BY item.item_id
```

will show the rows in a table called `item`, and show the count of related rows in a table called `uses`. This works well, but unfortunately it's not standard SQL-92.

Why not? because the **SELECT** clause (and the **ORDER BY** clause) in **GROUP BY** queries must contain columns that are

1. mentioned in the **GROUP BY** clause, or
2. aggregate functions such as **COUNT()**, **MIN()**, and the like.

This example's **SELECT** clause mentions `item.name`, a column that does not meet either of those criteria. MySQL 5.6 and earlier will reject this query if the SQL mode contains `ONLY_FULL_GROUP_BY`.

This example query can be made to comply with the SQL-92 standard by changing the **GROUP BY** clause, like this.

```
SELECT item.item_id, item.name,  
       COUNT(*) number_of_uses  
FROM item  
JOIN uses ON item.item_id, uses.item_id  
GROUP BY item.item_id, item.name
```

The later SQL-99 standard allows a **SELECT** statement to omit unaggregated columns from the group key if the DBMS can prove a functional dependence between them and the group key columns. Because `item.name` is functionally dependent on `item.item_id`, the initial example is valid SQL-99. MySQL gained a [functional dependence prover](#) in version 5.7. The original example works under `ONLY_FULL_GROUP_BY`.

Chapter 16: Joins

Section 16.1: Joins visualized

If you are a visually oriented person, this Venn diagram may help you understand the different types of **JOINS** that exist within MySQL.

Section 16.2: JOIN with subquery ("Derived" table)

```
SELECT x, ...
FROM ( SELECT y, ... FROM ... ) AS a
JOIN tbl ON tbl.x = a.y
WHERE ...
```

This will evaluate the subquery into a temp table, then **JOIN** that to tbl.

Prior to 5.6, there could not be an index on the temp table. So, this was potentially very inefficient:

```
SELECT ...
FROM ( SELECT y, ... FROM ... ) AS a
JOIN ( SELECT x, ... FROM ... ) AS b ON b.x = a.y
WHERE ...
```

With 5.6, the optimizer figures out the best index and creates it on the fly. (This has some overhead, so it is still not 'perfect'.)

Another common paradigm is to have a subquery to initialize something:

```
SELECT
    @n := @n + 1,
    ...
FROM ( SELECT @n := 0 ) AS initialize
JOIN the_real_table
ORDER BY ...
```

(Note: this is technically a **CROSS JOIN** (Cartesian product), as indicated by the lack of ON. However it is efficient because the subquery returns only one row that has to be matched to the n rows in the_real_table.)

Section 16.3: Full Outer Join

MySQL does not support the **FULL OUTER JOIN**, but there are ways to emulate one.

Setting up the data

```
-- -----
-- Table structure for `owners`
-- -----
DROP TABLE IF EXISTS `owners`;
CREATE TABLE `owners` (
  `owner_id` int(11) NOT NULL AUTO_INCREMENT,
  `owner` varchar(30) DEFAULT NULL,
  PRIMARY KEY (`owner_id`)
) ENGINE=InnoDB AUTO_INCREMENT=10 DEFAULT CHARSET=latin1;

-- -----
-- Records of owners
-- -----
INSERT INTO `owners` VALUES ('1', 'Ben');
INSERT INTO `owners` VALUES ('2', 'Jim');
INSERT INTO `owners` VALUES ('3', 'Harry');
INSERT INTO `owners` VALUES ('6', 'John');
INSERT INTO `owners` VALUES ('9', 'Ellie');

-- -----
-- Table structure for `tools`
-- -----
DROP TABLE IF EXISTS `tools`;
CREATE TABLE `tools` (
  `tool_id` int(11) NOT NULL AUTO_INCREMENT,
  `tool` varchar(30) DEFAULT NULL,
  `owner_id` int(11) DEFAULT NULL,
  PRIMARY KEY (`tool_id`)
) ENGINE=InnoDB AUTO_INCREMENT=11 DEFAULT CHARSET=latin1;

-- -----
-- Records of tools
-- -----
INSERT INTO `tools` VALUES ('1', 'Hammer', '9');
INSERT INTO `tools` VALUES ('2', 'Pliers', '1');
INSERT INTO `tools` VALUES ('3', 'Knife', '1');
INSERT INTO `tools` VALUES ('4', 'Chisel', '2');
INSERT INTO `tools` VALUES ('5', 'Hacksaw', '1');
INSERT INTO `tools` VALUES ('6', 'Level', null);
INSERT INTO `tools` VALUES ('7', 'Wrench', null);
INSERT INTO `tools` VALUES ('8', 'Tape Measure', '9');
INSERT INTO `tools` VALUES ('9', 'Screwdriver', null);
INSERT INTO `tools` VALUES ('10', 'Clamp', null);
```

What do we want to see?

We want to get a list, in which we see who owns which tools, and which tools might not have an owner.

The queries

To accomplish this, we can combine two queries by using **UNION**. In this first query we are joining the tools on the owners by using a **LEFT JOIN**. This will add all of our owners to our resultset, doesn't matter if they actually own tools.

In the second query we are using a **RIGHT JOIN** to join the tools onto the owners. This way we manage to get all the tools in our resultset, if they are owned by no one their owner column will simply contain **NULL**. By adding a **WHERE**-clause which is filtering by `owners.owner_id IS NULL` we are defining the result as those datasets, which have not already been returned by the first query, as we are only looking for the data in the right joined table.

Since we are using **UNION ALL** the resultset of the second query will be attached to the first queries resultset.

```
SELECT `owners`.`owner`, tools.tool
FROM `owners`
LEFT JOIN `tools` ON `owners`.`owner_id` = `tools`.`owner_id`
UNION ALL
SELECT `owners`.`owner`, tools.tool
FROM `owners`
RIGHT JOIN `tools` ON `owners`.`owner_id` = `tools`.`owner_id`
WHERE `owners`.`owner_id` IS NULL;
```

```
+-----+-----+
| owner | tool      |
+-----+-----+
| Ben   | Pliers    |
| Ben   | Knife     |
| Ben   | Hacksaw   |
| Jim   | Chisel    |
| Harry | NULL      |
| John  | NULL      |
| Ellie | Hammer    |
| Ellie | Tape Measure |
| NULL  | Level     |
| NULL  | Wrench    |
| NULL  | Screwdriver |
| NULL  | Clamp     |
+-----+-----+
12 rows in set (0.00 sec)
```

Section 16.4: Retrieve customers with orders -- variations on a theme

This will get all the orders for all customers:

```
SELECT c.CustomerName, o.OrderID
FROM Customers AS c
INNER JOIN Orders AS o
ON c.CustomerID = o.CustomerID
ORDER BY c.CustomerName, o.OrderID;
```

This will count the number of orders for each customer:

```
SELECT c.CustomerName, COUNT(*) AS 'Order Count'
FROM Customers AS c
INNER JOIN Orders AS o
    ON c.CustomerID = o.CustomerID
GROUP BY c.CustomerID;
ORDER BY c.CustomerName;
```

Also, counts, but probably faster:

```
SELECT c.CustomerName,
    ( SELECT COUNT(*) FROM Orders WHERE CustomerID = c.CustomerID ) AS 'Order Count'
FROM Customers AS c
ORDER BY c.CustomerName;
```

List only the customer with orders.

```
SELECT c.CustomerName,
FROM Customers AS c
WHERE EXISTS ( SELECT * FROM Orders WHERE CustomerID = c.CustomerID )
ORDER BY c.CustomerName;
```

Section 16.5: Joining Examples

Query to create table on db

```
CREATE TABLE `user` (
`id` smallint(5) unsigned NOT NULL AUTO_INCREMENT,
`name` varchar(30) NOT NULL,
`course` smallint(5) unsigned DEFAULT NULL,
PRIMARY KEY (`id`)
) ENGINE=InnoDB;

CREATE TABLE `course` (
`id` smallint(5) unsigned NOT NULL AUTO_INCREMENT,
`name` varchar(50) NOT NULL,
PRIMARY KEY (`id`)
) ENGINE=InnoDB;
```

Since we're using InnoDB tables and know that user.course and course.id are related, we can specify a foreign key relationship:

```
ALTER TABLE `user`
ADD CONSTRAINT `FK_course`
FOREIGN KEY (`course`) REFERENCES `course` (`id`)
ON UPDATE CASCADE;
```

Join Query (Inner Join)

```
SELECT user.name, course.name
FROM `user`
INNER JOIN `course` on user.course = course.id;
```

Chapter 17: JOINS: Join 3 table with the same name of id.

Section 17.1: Join 3 tables on a column with the same name

```
CREATE TABLE Table1 (  
    id INT UNSIGNED NOT NULL,  
    created_on DATE NOT NULL,  
    PRIMARY KEY (id)  
)  
CREATE TABLE Table2 (  
    id INT UNSIGNED NOT NULL,  
    personName VARCHAR(255) NOT NULL,  
    PRIMARY KEY (id)  
)  
CREATE TABLE Table3 (  
    id INT UNSIGNED NOT NULL,  
    accountName VARCHAR(255) NOT NULL,  
    PRIMARY KEY (id)  
)
```

after creating the tables you could do a select query to get the id's of all three tables that are the same

```
SELECT  
    t1.id AS table1Id,  
    t2.id AS table2Id,  
    t3.id AS table3Id  
FROM Table1 t1  
LEFT JOIN Table2 t2 ON t2.id = t1.id  
LEFT JOIN Table3 t3 ON t3.id = t1.id
```

Chapter 18: UNION

Section 18.1: Combining SELECT statements with UNION

You can combine the results of two identically structured queries with the **UNION** keyword.

For example, if you wanted a list of all contact info from two separate tables, authors and editors, for instance, you could use the **UNION** keyword like so:

```
select name, email, phone_number
from authors

union

select name, email, phone_number
from editors
```

Using **union** by itself will strip out duplicates. If you needed to keep duplicates in your query, you could use the **ALL** keyword like so: **UNION ALL**.

Section 18.2: Combining data with different columns

```
SELECT name, caption as title, year, pages FROM books
UNION
SELECT name, title, year, 0 as pages FROM movies
```

When combining 2 record sets with different columns then emulate the missing ones with default values.

Section 18.3: ORDER BY

If you need to sort the results of a UNION, use this pattern:

```
( SELECT ... )
UNION
( SELECT ... )
ORDER BY
```

Without the parentheses, the final ORDER BY would belong to the last SELECT.

Section 18.4: Pagination via OFFSET

When adding a LIMIT to a UNION, this is the pattern to use:

```
( SELECT ... ORDER BY x LIMIT 10 )
UNION
( SELECT ... ORDER BY x LIMIT 10 )
ORDER BY x LIMIT 10
```

Since you cannot predict which SELECT(s) will the "10" will come from, you need to get 10 from each, then further whittle down the list, repeating both the **ORDER BY** and **LIMIT**.

For the 4th page of 10 items, this pattern is needed:

```
( SELECT ... ORDER BY x LIMIT 40 )
```

```
UNION
( SELECT ... ORDER BY x LIMIT 40 )
ORDER BY x LIMIT 30, 10
```

That is, collect 4 page's worth in each **SELECT**, then do the **OFFSET** in the **UNION**.

Section 18.5: Combining and merging data on different MySQL tables with the same columns into unique rows and running query

This **UNION ALL** combines data from multiple tables and serve as a table name alias to use for your queries:

```
SELECT YEAR(date_time_column), MONTH(date_time_column), MIN(
DATE(date_time_column)),
MAX(
DATE(date_time_column)), COUNT(DISTINCT (ip)), COUNT(ip),
(COUNT(ip) / COUNT(DISTINCT (ip))) AS
Ratio
FROM (
  (SELECT date_time_column, ip FROM server_log_1 WHERE state = 'action' AND log_id = 150) UNION
  ALL
  (SELECT date_time_column, ip FROM server_log_2 WHERE state = 'action' AND log_id = 150) UNION
  ALL
  (SELECT date_time_column, ip FROM server_log_3 WHERE state = 'action' AND log_id = 150) UNION
  ALL
  (SELECT date_time_column, ip FROM server_log WHERE state = 'action' AND log_id = 150)
) AS table_all
GROUP BY YEAR(date_time_column), MONTH(date_time_column);
```

Section 18.6: UNION ALL and UNION

SELECT 1,22,44 UNION SELECT 2,33,55

信息	结果1	概况	状态
1	22	44	
1	22	44	
2	33	55	

SELECT 1,22,44 UNION SELECT 2,33,55 UNION SELECT 2,33,55

The result is the same as above.

use UNION ALL

when

SELECT 1,22,44 UNION SELECT 2,33,55 UNION ALL SELECT 2,33,55

信息	结果1	概况	状态
1	22	44	
1	22	44	
2	33	55	
2	33	55	

Chapter 19: Arithmetic

Section 19.1: Arithmetic Operators

MySQL provides the following arithmetic operators

Operator	Name	Example
+	Addition	<code>SELECT 3+5; -> 8</code>
		<code>SELECT 3.5+2.5; -> 6.0</code>
		<code>SELECT 3.5+2; -> 5.5</code>
-	Subtraction	<code>SELECT 3-5; -> -2</code>
*	Multiplication	<code>SELECT 3 * 5; -> 15</code>
		<code>SELECT 20 / 4; -> 5</code>
/	Division	<code>SELECT 355 / 113; -> 3.1416</code>
		<code>SELECT 10.0 / 0; -> NULL</code>
		<code>SELECT 5 DIV 2; -> 2</code>
% or MOD	Modulo	<code>SELECT 7 % 3; -> 1</code>
		<code>SELECT 15 MOD 4 -> 3</code>
		<code>SELECT 15 MOD -4 -> 3</code>
		<code>SELECT -15 MOD 4 -> -3</code>
		<code>SELECT -15 MOD -4 -> -3</code>
		<code>SELECT 3 MOD 2.5 -> 0.5</code>

BIGINT

If the numbers in your arithmetic are all integers, MySQL uses the **BIGINT** (signed 64-bit) integer data type to do its work. For example:

```
select (1024 * 1024 * 1024 * 1024 * 1024 * 1024) + 1 -> 1,152,921,504,606,846,977
```

and

```
select (1024 * 1024 * 1024 * 1024 * 1024 * 1024 * 1024 * 1024) -> BIGINT out of range error
```

DOUBLE

If any numbers in your arithmetic are fractional, MySQL uses [64-bit IEEE 754 floating point arithmetic](#). You must be careful when using floating point arithmetic, because many [floating point numbers are, inherently, approximations rather than exact values](#).

Section 19.2: Mathematical Constants

Pi

The following returns the value of PI formatted to 6 decimal places. The actual value is good to **DOUBLE**;

```
SELECT PI(); -> 3.141593
```

Section 19.3: Trigonometry (SIN, COS)

Angles are in Radians, not Degrees. All computations are done in [IEEE 754 64-bit floating point](#). All floating point computations are subject to small errors, known as [machine ε \(epsilon\) errors](#), so avoid trying to compare them for equality. There is no way to avoid these errors when using floating point; they are built in to the technology.

If you use **DECIMAL** values in trigonometric computations, they are implicitly converted to floating point, and then back to decimal.

Sine

Returns the sine of a number X expressed in radians

```
SELECT SIN(PI()); -> 1.2246063538224e-16
```

Cosine

Returns the cosine of X when X is given in radians

```
SELECT COS(PI()); -> -1
```

Tangent

Returns the tangent of a number X expressed in radians. Notice the result is very close to zero, but not exactly zero. This is an example of machine ϵ .

```
SELECT TAN(PI()); -> -1.2246063538224e-16
```

Arc Cosine (inverse cosine)

Returns the arc cosine of X if X is in the range -1 to 1

```
SELECT ACOS(1); -> 0
SELECT ACOS(1.01); -> NULL
```

Arc Sine (inverse sine)

Returns the arc sine of X if X is in the range -1 to 1

```
SELECT ASIN(0.2); -> 0.20135792079033
```

Arc Tangent (inverse tangent)

`ATAN(x)` returns the arc tangent of a single number.

```
SELECT ATAN(2); -> 1.1071487177941
```

`ATAN2(X, Y)` returns the arc tangent of the two variables X and Y. It is similar to calculating the arc tangent of Y / X. But it is numerically more robust: it functions correctly when X is near zero, and the signs of both arguments are used to determine the quadrant of the result.

Best practice suggests writing formulas to use `ATAN2()` rather than `ATAN()` wherever possible.

```
ATAN2(1,1); -> 0.7853981633974483 (45 degrees)
ATAN2(1,-1); -> 2.356194490192345 (135 degrees)
ATAN2(0, -1); -> PI (180 degrees) don't try ATAN(-1 / 0)... it won't work
```

Cotangent

Returns the cotangent of X

```
SELECT COT(12); -> -1.5726734063977
```

Conversion

```
SELECT RADIANS(90) -> 1.5707963267948966
SELECT SIN(RADIANS(90)) -> 1
SELECT DEGREES(1), DEGREES(PI()) -> 57.29577951308232, 180
```

Section 19.4: Rounding (ROUND, FLOOR, CEIL)

Round a decimal number to an integer value

For exact numeric values (e.g. **DECIMAL**): If the first decimal place of a number is 5 or higher, this function will round a number to the next integer *away from zero*. If that decimal place is 4 or lower, this function will round to the next integer value *closest to zero*.

```
SELECT ROUND(4.51) -> 5
SELECT ROUND(4.49) -> 4
SELECT ROUND(-4.51) -> -5
```

For approximate numeric values (e.g. **DOUBLE**): The result of the **ROUND()** function depends on the C library; on many systems, this means that **ROUND()** uses the *round to the nearest even* rule:

```
SELECT ROUND(45e-1) -> 4 -- The nearest even value is 4
SELECT ROUND(55e-1) -> 6 -- The nearest even value is 6
```

Round up a number

To round up a number use either the **CEIL()** or **CEILING()** function

```
SELECT CEIL(1.23) -> 2
SELECT CEILING(4.83) -> 5
```

Round down a number

To round down a number, use the **FLOOR()** function

```
SELECT FLOOR(1.99) -> 1
```

FLOOR and CEIL go toward / away from -infinity:

```
SELECT FLOOR(-1.01), CEIL(-1.01) -> -2 and -1
SELECT FLOOR(-1.99), CEIL(-1.99) -> -2 and -1
```

Round a decimal number to a specified number of decimal places.

```
SELECT ROUND(1234.987, 2) -> 1234.99
SELECT ROUND(1234.987, -2) -> 1200
```

The discussion of up versus down and "5" applies, too.

Section 19.5: Raise a number to a power (POW)

To raise a number *x* to a power *y*, use either the **POW()** or **POWER()** functions

```
SELECT POW(2,2); => 4
SELECT POW(4,2); => 16
```

Section 19.6: Square Root (SQRT)

Use the `SQRT()` function. If the number is negative, `NULL` will be returned

```
SELECT SQRT(16); -> 4
SELECT SQRT(-3); -> NULL
```

Section 19.7: Random Numbers (RAND)

Generate a random number

To generate a pseudorandom floating point number between 0 and 1, use the `RAND()` function

Suppose you have the following query

```
SELECT i, RAND() FROM t;
```

This will return something like this

```
i      RAND()
1 0.6191438870682
2 0.93845168309142
3 0.83482678498591
```

Random Number in a range

To generate a random number in the range $a \leq n \leq b$, you can use the following formula

```
FLOOR(a + RAND() * (b - a + 1))
```

For example, this will generate a random number between 7 and 12

```
SELECT FLOOR(7 + (RAND() * 6));
```

A simple way to randomly return the rows in a table:

```
SELECT * FROM tbl ORDER BY RAND();
```

These are **pseudorandom** numbers.

The pseudorandom number generator in MySQL is not cryptographically secure. That is, if you use MySQL to generate random numbers to be used as secrets, a determined adversary who knows you used MySQL will be able to guess your secrets more easily than you might believe.

Section 19.8: Absolute Value and Sign (ABS, SIGN)

Return the absolute value of a number

```
SELECT ABS(2); -> 2
SELECT ABS(-46); -> 46
```

The `sign` of a number compares it to 0.

Sign Result	Example
-1 $n < 0$	<code>SELECT SIGN(42);</code> -> 1

```
0    n = 0  SELECT SIGN(0); -> 0
1    n > 0  SELECT SIGN(-3); -> -1
SELECT SIGN(-423421); -> -1
```

Chapter 20: String operations

Name	Description
ASCII()	Return numeric value of left-most character
BIN()	Return a string containing binary representation of a number
BIT_LENGTH()	Return length of argument in bits
CHAR()	Return the character for each integer passed
CHAR_LENGTH()	Return number of characters in argument
CHARACTER_LENGTH()	Synonym for CHAR_LENGTH()
CONCAT()	Return concatenated string
CONCAT_WS()	Return concatenate with separator
ELT()	Return string at index number
EXPORT_SET()	Return a string such that for every bit set in the value bits, you get an on string and for every unset bit, you get an off string
FIELD()	Return the index (position) of the first argument in the subsequent arguments
FIND_IN_SET()	Return the index position of the first argument within the second argument
FORMAT()	Return a number formatted to specified number of decimal places
FROM_BASE64()	Decode to a base-64 string and return result
HEX()	Return a hexadecimal representation of a decimal or string value
INSERT()	Insert a substring at the specified position up to the specified number of characters
INSTR()	Return the index of the first occurrence of substring
LCASE()	Synonym for LOWER()
LEFT()	Return the leftmost number of characters as specified
LENGTH()	Return the length of a string in bytes
LIKE	Simple pattern matching
LOAD_FILE()	Load the named file
LOCATE()	Return the position of the first occurrence of substring
LOWER()	Return the argument in lowercase
LPAD()	Return the string argument, left-padded with the specified string
LTRIM()	Remove leading spaces
MAKE_SET()	Return a set of comma-separated strings that have the corresponding bit in bits set
MATCH	Perform full-text search
MID()	Return a substring starting from the specified position
NOT LIKE	Negation of simple pattern matching
NOT REGEXP	Negation of REGEXP
OCT()	Return a string containing octal representation of a number
OCTET_LENGTH()	Synonym for LENGTH()
ORD()	Return character code for leftmost character of the argument
POSITION()	Synonym for LOCATE()
QUOTE()	Escape the argument for use in an SQL statement
REGEXP	Pattern matching using regular expressions
REPEAT()	Repeat a string the specified number of times
REPLACE()	Replace occurrences of a specified string
REVERSE()	Reverse the characters in a string
RIGHT()	Return the specified rightmost number of characters
RLIKE	Synonym for REGEXP
RPAD()	Append string the specified number of times
RTRIM()	Remove trailing spaces
SOUNDEX()	Return a soundex string
SOUNDS LIKE	Compare sounds
SPACE()	Return a string of the specified number of spaces
STRCMP()	Compare two strings
SUBSTR()	Return the substring as specified
SUBSTRING()	Return the substring as specified

SUBSTRING_INDEX()	Return a substring from a string before the specified number of occurrences of the delimiter
TO_BASE64()	Return the argument converted to a base-64 string
TRIM()	Remove leading and trailing spaces
UCASE()	Synonym for UPPER()
UNHEX()	Return a string containing hex representation of a number
UPPER()	Convert to uppercase
WEIGHT_STRING()	Return the weight string for a string

Section 20.1: LENGTH()

Return the length of the string in bytes. Since some characters may be encoded using more than one byte, if you want the length in characters see CHAR_LENGTH()

Syntax: LENGTH(str)

```
LENGTH('foobar') -- 6
LENGTH('fööbar') -- 8 -- contrast with CHAR_LENGTH(...) = 6
```

Section 20.2: CHAR_LENGTH()

Return the number of characters in the string

Syntax: CHAR_LENGTH(str)

```
CHAR_LENGTH('foobar') -- 6
CHAR_LENGTH('fööbar') -- 6 -- contrast with LENGTH(...) = 8
```

Section 20.3: HEX(str)

Convert the argument to hexadecimal. This is used for strings.

```
HEX('fööbar') -- 66F6F6626172 -- in "CHARACTER SET latin1" because "F6" is hex for ö
HEX('fööbar') -- 66C3B6C3B6626172 -- in "CHARACTER SET utf8 or utf8mb4" because "C3B6" is hex for ö
```

Section 20.4: SUBSTRING()

SUBSTRING (or equivalent: SUBSTR) returns the substring starting from the specified position and, optionally, with the specified length

Syntax: SUBSTRING(str, start_position)

```
SELECT SUBSTRING('foobarbaz', 4); -- 'barbaz'
SELECT SUBSTRING('foobarbaz' FROM 4); -- 'barbaz'

-- using negative indexing
SELECT SUBSTRING('foobarbaz', -6); -- 'barbaz'
SELECT SUBSTRING('foobarbaz' FROM -6); -- 'barbaz'
```

Syntax: SUBSTRING(str, start_position, length)

```
SELECT SUBSTRING('foobarbaz', 4, 3); -- 'bar'
SELECT SUBSTRING('foobarbaz', FROM 4 FOR 3); -- 'bar'

-- using negative indexing
```

```
SELECT SUBSTRING('foobarbaz', -6, 3); -- 'bar'
SELECT SUBSTRING('foobarbaz' FROM -6 FOR 3); -- 'bar'
```

Section 20.5: UPPER() / UCASE()

Convert in uppercase the string argument

Syntax: UPPER(str)

```
UPPER('fOoBar') -- 'FOOBAR'
UCASE('fOoBar') -- 'FOOBAR'
```

Section 20.6: STR_TO_DATE - Convert string to date

With a column of one of the string types, named `my_date_field` with a value such as [the string] `07/25/2016`, the following statement demonstrates the use of the `STR_TO_DATE` function:

```
SELECT STR_TO_DATE(my_date_field, '%m/%d/%Y') FROM my_table;
```

You could use this function as part of **WHERE** clause as well.

Section 20.7: LOWER() / LCASE()

Convert in lowercase the string argument

Syntax: LOWER(str)

```
LOWER('fOoBar') -- 'foobar'
LCASE('fOoBar') -- 'foobar'
```

Section 20.8: REPLACE()

Convert in lowercase the string argument

Syntax: REPLACE(str, from_str, to_str)

```
REPLACE('foobarbaz', 'bar', 'BAR') -- 'fooBARbaz'
REPLACE('foobarbaz', 'zzz', 'ZZZ') -- 'foobarbaz'
```

Section 20.9: Find element in comma separated list

```
SELECT FIND_IN_SET('b', 'a,b,c');
```

Return value:

```
|
2
```

```
SELECT FIND_IN_SET('d', 'a,b,c');
```

Return value:

```
|
```

Chapter 21: Date and Time Operations

Section 21.1: Date arithmetic

```
NOW() + INTERVAL 1 DAY -- This time tomorrow

CURDATE() - INTERVAL 4 DAY -- Midnight 4 mornings ago
```

Show the mysql questions stored that were asked 3 to 10 hours ago (180 to 600 minutes ago):

```
SELECT qId, askDate, minuteDiff
FROM
(
  SELECT qId, askDate,
    TIMESTAMPDIFF(MINUTE, askDate, now()) as minuteDiff
  FROM questions_mysql
) xDerived
WHERE minuteDiff BETWEEN 180 AND 600
ORDER BY qId DESC
LIMIT 50;
```

qId	askDate	minuteDiff
38546828	2016-07-23 22:06:50	182
38546733	2016-07-23 21:53:26	195
38546707	2016-07-23 21:48:46	200
38546687	2016-07-23 21:45:26	203
...		

MySQL manual pages for [TIMESTAMPDIFF\(\)](#).

Beware Do not try to use expressions like `CURDATE() + 1` for date arithmetic in MySQL. They don't return what you expect, especially if you're accustomed to the Oracle database product. Use `CURDATE() + INTERVAL 1 DAY` instead.

Section 21.2: SYSDATE(), NOW(), CURDATE()

```
SELECT SYSDATE();
```

This function returns the current date and time as a value in 'YYYY-MM-DD HH:MM:SS' or YYYYMMDDHHMMSS format, depending on whether the function is used in a string or numeric context. It returns the date and time in the current time zone.

```
SELECT NOW();
```

This function is a synonym for `SYSDATE()`.

```
SELECT CURDATE();
```

This function returns the current date, without any time, as a value in 'YYYY-MM-DD' or YYYYMMDD format, depending on whether the function is used in a string or numeric context. It returns the date in the current time zone.

Section 21.3: Testing against a date range

Although it is very tempting to use **BETWEEN** ... **AND** ... for a date range, it is problematical. Instead, this pattern avoids most problems:

```
WHERE x >= '2016-02-25'
AND x < '2016-02-25' + INTERVAL 5 DAY
```

Advantages:

- **BETWEEN** is 'inclusive' thereby including the final date or second.
- **23:59:59** is clumsy and wrong if you have microsecond resolution on a **DATETIME**.
- This pattern avoid dealing with leap years and other data calculations.
- It works whether x is **DATE**, **DATETIME** or **TIMESTAMP**.

Section 21.4: Extract Date from Given Date or DateTime Expression

```
SELECT DATE('2003-12-31 01:02:03');
```

The output will be:

```
2003-12-31
```

Section 21.5: Using an index for a date and time lookup

Many real-world database tables have many rows with **DATETIME** OR **TIMESTAMP** column values spanning a lot of time, including years or even decades. Often it's necessary to use a **WHERE** clause to retrieve some subset of that timespan. For example, we might want to retrieve rows for the date 1-September-2016 from a table.

An inefficient way to do that is this:

```
WHERE DATE(x) = '2016-09-01' /* slow! */
```

It's inefficient because it applies a function -- **DATE()** -- to the values of a column. That means MySQL must examine each value of x, and an index cannot be used.

A better way to do the operation is this

```
WHERE x >= '2016-09-01'
AND x < '2016-09-01' + INTERVAL 1 DAY
```

This selects a range of values of x lying anywhere on the day in question, up until but *not including* (hence **<**) midnight on the next day.

If the table has an index on the x column, then the database server can perform a range scan on the index. That means it can quickly find the first relevant value of x, and then scan the index sequentially until it finds the last relevant value. An index range scan is much more efficient than the full table scan required by **DATE(x) = '2016-09-01'**.

Don't be tempted to use this, even though it looks more efficient.

```
WHERE x BETWEEN '2016-09-01' AND '2016-09-01' + INTERVAL 1 DAY /* wrong! */
```

It has the same efficiency as the range scan, but it will select rows with values of x falling exactly at midnight on 2-Sept-2016, which is not what you want.

Section 21.6: Now()

```
Select Now();
```

Shows the current server date and time.

```
Update `footable` set mydatefield = Now();
```

This will update the field mydatefield with current server date and time in server's configured timezone, e.g.

```
'2016-07-21 12:00:00'
```

Chapter 22: Handling Time Zones

Section 22.1: Retrieve the current date and time in a particular time zone

This fetches the value of `NOW()` in local time, in India Standard Time, and then again in UTC.

```
SELECT NOW();
SET time_zone='Asia/Kolkata';
SELECT NOW();
SET time_zone='UTC';
SELECT NOW();
```

Section 22.2: Convert a stored `DATE` or `DATETIME` value to another time zone

If you have a stored `DATE` or `DATETIME` (in a column somewhere) it was stored with respect to some time zone, but in MySQL the time zone is *not* stored with the value. So, if you want to convert it to another time zone, you can, but you must know the original time zone. Using `CONVERT_TZ()` does the conversion. This example shows rows sold in California in local time.

```
SELECT CONVERT_TZ(date_sold, 'UTC', 'America/Los_Angeles') date_sold_local
FROM sales
WHERE state_sold = 'CA'
```

Section 22.3: Retrieve stored `TIMESTAMP` values in a particular time zone

This is really easy. All `TIMESTAMP` values are stored in universal time, and always converted to the present `time_zone` setting whenever they are rendered.

```
SET SESSION time_zone='America/Los_Angeles';
SELECT timestamp_sold
FROM sales
WHERE state_sold = 'CA'
```

Why is this? `TIMESTAMP` values are based on the venerable [UNIX time_t data type](#). Those UNIX timestamps are stored as a number of seconds since `1970-01-01 00:00:00 UTC`.

Notice `TIMESTAMP` values are stored in universal time. `DATE` and `DATETIME` values are stored in whatever local time was in effect when they were stored.

Section 22.4: What is my server's local time zone setting?

Each server has a default global `time_zone` setting, configured by the owner of the server machine. You can find out the current time zone setting this way:

```
SELECT @@time_zone
```

Unfortunately, that usually yields the value `SYSTEM`, meaning the MySQL time is governed by the server OS's time zone setting.

This sequence of queries (yes, [it's a hack](#)) gives you back the offset in minutes between the server's time zone

setting and UTC.

```
CREATE TEMPORARY TABLE times (dt DATETIME, ts TIMESTAMP);
SET time_zone = 'UTC';
INSERT INTO times VALUES(NOW(), NOW());
SET time_zone = 'SYSTEM';
SELECT dt, ts, TIMESTAMPDIFF(MINUTE, dt, ts)offset FROM times;
DROP TEMPORARY TABLE times;
```

How does this work? The two columns in the temporary table with different data types is the clue. **DATETIME** data types are always stored in local time in tables, and **TIMESTAMPS** in UTC. So the **INSERT** statement, performed when the time_zone is set to UTC, stores two identical date / time values.

Then, the SELECT statement, is done when the time_zone is set to server local time. **TIMESTAMPS** are always translated from their stored UTC form to local time in SELECT statements. **DATETIMES** are not. So the [TIMESTAMPDIFF\(MINUTE...\) operation](#) computes the difference between local and universal time.

Section 22.5: What time_zone values are available in my server?

To get a list of possible time_zone values in your MySQL server instance, use this command.

```
SELECT mysql.time_zone_name.name
```

Ordinarily, this shows the [ZoneInfo list of time zones](#) maintained by Paul Eggert at the [Internet Assigned Numbers Authority](#). Worldwide there are approximately 600 time zones.

Unix-like operating systems (Linux distributions, BSD distributions, and modern Mac OS distributions, for example) receive routine updates. Installing these updates on an operating system lets the MySQL instances running there track the changes in time zone and daylight / standard time changeovers.

If you get a much shorter list of time zone names, your server is either incompletely configured or running on Windows. [Here are instructions](#) for your server administrator to install and maintain the ZoneInfo list.

Chapter 23: Regular Expressions

A regular expression is a powerful way of specifying a pattern for a complex search.

Section 23.1: REGEXP / RLIKE

The **REGEXP** (or its synonym, **RLIKE**) operator allows pattern matching based on regular expressions.

Consider the following employee table:

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	PHONE_NUMBER	SALARY
100	Steven	King	515.123.4567	24000.00
101	Neena	Kochhar	515.123.4568	17000.00
102	Lex	De Haan	515.123.4569	17000.00
103	Alexander	Hunold	590.423.4567	9000.00
104	Bruce	Ernst	590.423.4568	6000.00
105	David	Austin	590.423.4569	4800.00
106	Valli	Pataballa	590.423.4560	4800.00
107	Diana	Lorentz	590.423.5567	4200.00
108	Nancy	Greenberg	515.124.4569	12000.00
109	Daniel	Faviet	515.124.4169	9000.00
110	John	Chen	515.124.4269	8200.00

Pattern ^

Select all employees whose `FIRST_NAME` starts with **N**.

Query

```
SELECT * FROM employees WHERE FIRST_NAME REGEXP '^N'
-- Pattern start with-----^
```

Pattern \$**

Select all employees whose `PHONE_NUMBER` ends with **4569**.

Query

```
SELECT * FROM employees WHERE PHONE_NUMBER REGEXP '4569$'
-- Pattern end with-----^
```

NOT REGEXP

Select all employees whose `FIRST_NAME` *does not* start with **N**.

Query

```
SELECT * FROM employees WHERE FIRST_NAME NOT REGEXP '^N'
-- Pattern does not start with-----^
```

Regex Contain

Select all employees whose LAST_NAME contains **in** and whose FIRST_NAME contains **a**.

Query

```
SELECT * FROM employees WHERE FIRST_NAME REGEXP 'a' AND LAST_NAME REGEXP 'in'
-- No ^ or $, pattern can be anywhere -----^
```

Any character between []

Select all employees whose FIRST_NAME starts with **A** or **B** or **C**.

Query

```
SELECT * FROM employees WHERE FIRST_NAME REGEXP '^[ABC]'
-----^^-----^
```

Pattern or |

Select all employees whose FIRST_NAME starts with **A** or **B** or **C** and ends with **r**, **e**, or **i**.

Query

```
SELECT * FROM employees WHERE FIRST_NAME REGEXP '^([ABC])[rei]$\n-----^^-----^^-----^^
```

Counting regular expression matches

Consider the following query:

```
SELECT FIRST_NAME, FIRST_NAME REGEXP '^N' as matching FROM employees
```

FIRST_NAME REGEXP '^N' is 1 or 0 depending on the fact that FIRST_NAME matches ^N.

To visualize it better:

```
SELECT
FIRST_NAME,
IF(FIRST_NAME REGEXP '^N', 'matches ^N', 'does not match ^N') as matching
FROM employees
```

Finally, count total number of matching and non-matching rows with:

```
SELECT
IF(FIRST_NAME REGEXP '^N', 'matches ^N', 'does not match ^N') as matching,
COUNT(*)
FROM employees
GROUP BY matching
```

Chapter 24: VIEW

Parameters	Details
view_name	Name of View
SELECT statement	SQL statements to be packed in the views. It can be a SELECT statement to fetch data from one or more tables.

Section 24.1: Create a View

Privileges

The CREATE VIEW statement requires the CREATE VIEW privilege for the view, and some privilege for each column selected by the SELECT statement. For columns used elsewhere in the SELECT statement, you must have the SELECT privilege. If the OR REPLACE clause is present, you must also have the DROP privilege for the view. CREATE VIEW might also require the SUPER privilege, depending on the DEFINER value, as described later in this section.

When a view is referenced, privilege checking occurs.

A view belongs to a database. By default, a new view is created in the default database. To create the view explicitly in a given database, use a fully qualified name

For Example:

db_name.view_name

```
mysql> CREATE VIEW test.v AS SELECT * FROM t;
```

Note - Within a database, base tables and views share the same namespace, so a base table and a view cannot have the same name.

A VIEW can:

- be created from many kinds of SELECT statements
- refer to base tables or other views
- use joins, UNION, and subqueries
- SELECT need not even refer to any tables

Another Example

The following example defines a view that selects two columns from another table as well as an expression calculated from those columns:

```
mysql> CREATE TABLE t (qty INT, price INT);
mysql> INSERT INTO t VALUES(3, 50);
mysql> CREATE VIEW v AS SELECT qty, price, qty*price AS value FROM t;
mysql> SELECT * FROM v;
```

```
+-----+-----+-----+
| qty  | price | value |
+-----+-----+-----+
| 3    | 50    | 150   |
+-----+-----+-----+
```

Restrictions

- Before MySQL 5.7.7, the SELECT statement cannot contain a subquery in the FROM clause.
- The SELECT statement cannot refer to system variables or user-defined variables.
- Within a stored program, the SELECT statement cannot refer to program parameters or local variables.
- The SELECT statement cannot refer to prepared statement parameters.
- Any table or view referred to in the definition must exist. After the view has been created, it is possible to drop a table or view that the definition refers to. In this case, use of the view results in an error. To check a view definition for problems of this kind, use the CHECK TABLE statement.
- The definition cannot refer to a TEMPORARY table, and you cannot create a TEMPORARY view.
- You cannot associate a trigger with a view.
- Aliases for column names in the SELECT statement are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters).
- A **VIEW** may or may not optimize as well as the equivalent **SELECT**. It is unlikely to optimize any better.

Section 24.2: A view from two tables

A view is most useful when it can be used to pull in data from more than one table.

```
CREATE VIEW myview AS
SELECT a.*, b.extra_data FROM main_table a
LEFT OUTER JOIN other_table b
ON a.id = b.id
```

In mysql views are not materialized. If you now perform the simple query **SELECT * FROM myview**, mysql will actually perform the LEFT JOIN behind the scene.

A view once created can be joined to other views or tables

Section 24.3: DROPPING A VIEW

-- Create and drop a view in the current database.

```
CREATE VIEW few_rows_from_t1 AS SELECT * FROM t1 LIMIT 10;
DROP VIEW few_rows_from_t1;
```

-- Create and drop a view referencing a table in a different database.

```
CREATE VIEW table_from_other_db AS SELECT x FROM db1.foo WHERE x IS NOT NULL;
DROP VIEW table_from_other_db;
```

Section 24.4: Updating a table via a VIEW

A **VIEW** acts very much like a table. Although you can **UPDATE** a table, you may or may not be able to update a view into that table. In general, if the **SELECT** in the view is complex enough to require a temp table, then **UPDATE** is not allowed.

Things like **GROUP BY**, **UNION**, **HAVING**, **DISTINCT**, and some subqueries prevent the view from being updatable. Details in [reference manual](#).

Chapter 25: Table Creation

Section 25.1: Table creation with Primary Key

```
CREATE TABLE Person (  
    PersonID      INT UNSIGNED NOT NULL,  
    LastName      VARCHAR(66) NOT NULL,  
    FirstName     VARCHAR(66),  
    Address       VARCHAR(255),  
    City          VARCHAR(66),  
    PRIMARY KEY (PersonID)  
);
```

A **primary key** is a **NOT NULL** single or a multi-column identifier which uniquely identifies a row of a table. An index is created, and if not explicitly declared as **NOT NULL**, MySQL will declare them so silently and implicitly.

A table can have only one **PRIMARY KEY**, and each table is recommended to have one. InnoDB will automatically create one in its absence, (as seen in [MySQL documentation](#)) though this is less desirable.

Often, an **AUTO_INCREMENT INT** also known as "surrogate key", is used for thin index optimization and relations with other tables. This value will (normally) increase by 1 whenever a new record is added, starting from a default value of 1.

However, despite its name, it is not its purpose to guarantee that values are incremental, merely that they are sequential and unique.

An auto-increment **INT** value will not reset to its default start value if all rows in the table are deleted, unless the table is truncated using **TRUNCATE TABLE** statement.

Defining one column as Primary Key (inline definition)

If the primary key consists of a single column, the **PRIMARY KEY** clause can be placed inline with the column definition:

```
CREATE TABLE Person (  
    PersonID      INT UNSIGNED NOT NULL PRIMARY KEY,  
    LastName      VARCHAR(66) NOT NULL,  
    FirstName     VARCHAR(66),  
    Address       VARCHAR(255),  
    City          VARCHAR(66)  
);
```

This form of the command is shorter and easier to read.

Defining a multiple-column Primary Key

It is also possible to define a primary key comprising more than one column. This might be done e.g. on the child table of a foreign-key relationship. A multi-column primary key is defined by listing the participating columns in a separate **PRIMARY KEY** clause. Inline syntax is not permitted here, as only one column may be declared **PRIMARY KEY** inline. For example:

```
CREATE TABLE invoice_line_items (  
    LineNum       SMALLINT UNSIGNED NOT NULL,  
    InvoiceNum     INT UNSIGNED NOT NULL,  
    -- Other columns go here
```

```
PRIMARY KEY (InvoiceNum, LineNum),  
FOREIGN KEY (InvoiceNum) REFERENCES -- references to an attribute of a table  
);
```

Note that the columns of the primary key *should* be specified in logical sort order, which *may* be different from the order in which the columns were defined, as in the example above.

Larger indexes require more disk space, memory, and I/O. Therefore keys should be as small as possible (especially regarding composed keys). In InnoDB, every 'secondary index' includes a copy of the columns of the **PRIMARY KEY**.

Section 25.2: Basic table creation

The **CREATE TABLE** statement is used to create a table in a MySQL database.

```
CREATE TABLE Person (  
    `PersonID`      INTEGER NOT NULL PRIMARY KEY,  
    `LastName`      VARCHAR(80),  
    `FirstName`     VARCHAR(80),  
    `Address`       TEXT,  
    `City`          VARCHAR(100)  
) Engine=InnoDB;
```

Every field definition must have:

1. Field name: A valid field Name. Make sure to enclose the names in ``-chars. This ensures that you can use eg space-chars in the fieldname.
2. Data type [Length]: If the field is **CHAR** or **VARCHAR**, it is mandatory to specify a field length.
3. Attributes **NULL** | **NOT NULL**: If **NOT NULL** is specified, then any attempt to store a **NULL** value in that field will fail.
4. See more on data types and their attributes [here](#).

Engine=... is an optional parameter used to specify the table's storage engine. If no storage engine is specified, the table will be created using the server's default table storage engine (usually InnoDB or MyISAM).

Setting defaults

Additionally, where it makes sense you can set a default value for each field by using **DEFAULT**:

```
CREATE TABLE Address (  
    `AddressID`     INTEGER NOT NULL PRIMARY KEY,  
    `Street`        VARCHAR(80),  
    `City`          VARCHAR(80),  
    `Country`       VARCHAR(80) DEFAULT "United States",  
    `Active`        BOOLEAN DEFAULT 1,  
) Engine=InnoDB;
```

If during inserts no `Street` is specified, that field will be **NULL** when retrieved. When no `Country` is specified upon insert, it will default to "United States".

You can set default values for all column types, [except](#) for **BLOB**, **TEXT**, **GEOMETRY**, and **JSON** fields.

Section 25.3: Table creation with Foreign Key

```
CREATE TABLE Account (  
    AccountID      INT UNSIGNED NOT NULL,  
    AccountNo      INT UNSIGNED NOT NULL,
```

```

PersonID    INT UNSIGNED,
PRIMARY KEY (AccountID),
FOREIGN KEY (PersonID) REFERENCES Person (PersonID)
) ENGINE=InnoDB;

```

Foreign key: A Foreign Key (FK) is either a single column, or multi-column composite of columns, in a *referencing* table. This FK is confirmed to exist in the *referenced* table. It is highly recommended that the *referenced* table key confirming the FK be a Primary Key, but that is not enforced. It is used as a fast-lookup into the *referenced* where it does not need to be unique, and in fact can be a left-most index there.

Foreign key relationships involve a parent table that holds the central data values, and a child table with identical values pointing back to its parent. The FOREIGN KEY clause is specified in the child table. The parent and child tables must use the same storage engine. They must not be [TEMPORARY](#) tables.

Corresponding columns in the foreign key and the referenced key must have similar data types. The size and sign of integer types must be the same. The length of string types need not be the same. For nonbinary (character) string columns, the character set and collation must be the same.

Note: foreign-key constraints are supported under the InnoDB storage engine (not MyISAM or MEMORY). DB set-ups using other engines will accept this **CREATE TABLE** statement but will not respect foreign-key constraints. (Although newer MySQL versions default to **InnoDB**, but it is good practice to be explicit.)

Section 25.4: Show Table Structure

If you want to see the schema information of your table, you can use one of the following:

```
SHOW CREATE TABLE child; -- Option 1
```

```

CREATE TABLE `child` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `fullName` varchar(100) NOT NULL,
  `myParent` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `mommy_daddy` (`myParent`),
  CONSTRAINT `mommy_daddy` FOREIGN KEY (`myParent`) REFERENCES `parent` (`id`)
  ON DELETE CASCADE ON UPDATE CASCADE
) ENGINE=InnoDB DEFAULT CHARSET=utf8;

```

If used from the mysql commandline tool, this is less verbose:

```
SHOW CREATE TABLE child \G
```

A less descriptive way of showing the table structure:

```
mysql> CREATE TABLE Tab1(id int, name varchar(30));
Query OK, 0 rows affected (0.03 sec)
```

```
mysql> DESCRIBE Tab1; -- Option 2
```

Field	Type	Null	Key	Default	Extra
id	int(11)	YES		NULL	
name	varchar(30)	YES		NULL	

Both **DESCRIBE** and **DESC** gives the same result.

To see **DESCRIBE** performed on all tables in a database at once, see this [Example](#).

Section 25.5: Cloning an existing table

A table can be replicated as follows:

```
CREATE TABLE ClonedPersons LIKE Persons;
```

The new table will have exactly the same structure as the original table, including indexes and column attributes.

As well as manually creating a table, it is also possible to create table by selecting data from another table:

```
CREATE TABLE ClonedPersons SELECT * FROM Persons;
```

You can use any of the normal features of a **SELECT** statement to modify the data as you go:

```
CREATE TABLE ModifiedPersons
SELECT PersonID, FirstName + LastName AS FullName FROM Persons
WHERE LastName IS NOT NULL;
```

Primary keys and indexes will not be preserved when creating tables from **SELECT**. You must redeclare them:

```
CREATE TABLE ModifiedPersons (PRIMARY KEY (PersonID))
SELECT PersonID, FirstName + LastName AS FullName FROM Persons
WHERE LastName IS NOT NULL;
```

Section 25.6: Table Create With TimeStamp Column To Show Last Update

The **TIMESTAMP** column will show when the row was last updated.

```
CREATE TABLE `TestLastUpdate` (
  `ID` INT NULL,
  `Name` VARCHAR(50) NULL,
  `Address` VARCHAR(50) NULL,
  `LastUpdate` TIMESTAMP NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
)
COMMENT='Last Update'
;
```

Section 25.7: CREATE TABLE FROM SELECT

You can create one table from another by adding a **SELECT** statement at the end of the **CREATE TABLE** statement:

```
CREATE TABLE stack (
  id_user INT,
  username VARCHAR(30),
  password VARCHAR(30)
);
```

Create a table in the same database:

```
-- create a table from another table in the same database with all attributes
CREATE TABLE stack2 AS SELECT * FROM stack;

-- create a table from another table in the same database with some attributes
CREATE TABLE stack3 AS SELECT username, password FROM stack;
```

Create tables from different databases:

```
-- create a table from another table from another database with all attributes
CREATE TABLE stack2 AS SELECT * FROM second_db.stack;

-- create a table from another table from another database with some attributes
CREATE TABLE stack3 AS SELECT username, password FROM second_db.stack;
```

N.B

To create a table same of another table that exist in another database, you need to specifies the name of the database like this:

```
FROM NAME_DATABASE.name_table
```

Chapter 26: ALTER TABLE

Section 26.1: Changing storage engine; rebuild table; change file_per_table

For example, if t1 is currently not an InnoDB table, this statement changes its storage engine to InnoDB:

```
ALTER TABLE t1 ENGINE = InnoDB;
```

If the table is already InnoDB, this will rebuild the table and its indexes and have an effect similar to **OPTIMIZE TABLE**. You may gain some disk space improvement.

If the value of innodb_file_per_table is currently different than the value in effect when t1 was built, this will convert to (or from) file_per_table.

Section 26.2: ALTER COLUMN OF TABLE

```
CREATE DATABASE stackoverflow;

USE stackoverflow;

Create table stack(
    id_user int NOT NULL,
    username varchar(30) NOT NULL,
    password varchar(30) NOT NULL
);

ALTER TABLE stack ADD COLUMN submit date NOT NULL; -- add new column
ALTER TABLE stack DROP COLUMN submit; -- drop column
ALTER TABLE stack MODIFY submit DATETIME NOT NULL; -- modify type column
ALTER TABLE stack CHANGE submit submit_date DATETIME NOT NULL; -- change type and name of column
ALTER TABLE stack ADD COLUMN mod_id INT NOT NULL AFTER id_user; -- add new column after existing column
```

Section 26.3: Change auto-increment value

Changing an auto-increment value is useful when you don't want a gap in an AUTO_INCREMENT column after a massive deletion.

For example, you got a lot of unwanted (advertisement) rows posted in your table, you deleted them, and you want to fix the gap in auto-increment values. Assume the MAX value of AUTO_INCREMENT column is 100 now. You can use the following to fix the auto-increment value.

```
ALTER TABLE your_table_name AUTO_INCREMENT = 101;
```

Section 26.4: Renaming a MySQL table

Renaming a table can be done in a single command:

```
RENAME TABLE `<old name>` TO `<new name>`;
```

The following syntax does exactly the same:

```
ALTER TABLE `<old name>` RENAME TO `<new name>`;
```

If renaming a temporary table, the **ALTER TABLE** version of the syntax must be used.

Steps:

1. Replace **<old name>** and **<new name>** in the line above with the relevant values. *Note: If the table is being moved to a different database, the dbname.tablename syntax can be used for <old name> and/or <new name>.*
2. Execute it on the relevant database in the MySQL command line or a client such as MySQL Workbench. *Note: The user must have ALTER and DROP privileges on the old table and CREATE and INSERT on the new one.*

Section 26.5: ALTER table add INDEX

To improve performance one might want to add indexes to columns

```
ALTER TABLE TABLE_NAME ADD INDEX `index_name` (`column_name`)
```

altering to add composite (multiple column) indexes

```
ALTER TABLE TABLE_NAME ADD INDEX `index_name` (`col1`, `col2`)
```

Section 26.6: Changing the type of a primary key column

```
ALTER TABLE fish_data.fish DROP PRIMARY KEY;  
ALTER TABLE fish_data.fish MODIFY COLUMN fish_id DECIMAL(20,0) NOT NULL PRIMARY KEY;
```

An attempt to modify the type of this column without first dropping the primary key would result in an error.

Section 26.7: Change column definition

To change the definition of a db column, the query below can be used for example, if we have this db schema

```
users (  
  firstname varchar(20),  
  lastname  varchar(20),  
  age char(2)  
)
```

To change the type of age column from **char** to **int**, we use the query below:

```
ALTER TABLE users CHANGE age age tinyint UNSIGNED NOT NULL;
```

General format is:

```
ALTER TABLE table_name CHANGE column_name new_column_definition
```

Section 26.8: Renaming a MySQL database

There is no single command to rename a MySQL database but a simple workaround can be used to achieve this by backing up and restoring:

```
mysqldump -uroot -p<password> create <new name>  
mysqldump -uroot -p<password> --routines <old name> | mysql -uroot -pmypassword <new name>  
mysqldump -uroot -p<password> drop <old name>
```

Steps:

1. Copy the lines above into a text editor.
2. Replace all references to **<old name>**, **<new name>** and **<password>** (+ optionally root to use a different user) with the relevant values.
3. Execute one by one on the command line (assuming the MySQL "bin" folder is in the path and entering "y" when prompted).

Alternative Steps:

Rename (move) each table from one db to the other. Do this for each table:

```
RENAME TABLE `<old db>`.`<name>` TO `<new db>`.`<name>`;
```

You can create those statements by doing something like

```
SELECT CONCAT('RENAME TABLE old_db.', table_name, ' TO ',
              'new_db.', table_name)
FROM information_schema.TABLES
WHERE table_schema = 'old_db';
```

Warning. Do not attempt to do any sort of table or database by simply moving files around on the filesystem. This worked fine in the old days of just MyISAM, but in the new days of InnoDB and tablespaces, it won't work. Especially when the "Data Dictionary" is moved from the filesystem into system InnoDB tables, probably in the next major release. Moving (as opposed to just DRoPPing) a **PARTITION** of an InnoDB table requires using "transportable tablespaces". In the near future, there won't even be a file to reach for.

Section 26.9: Swapping the names of two MySQL databases

The following commands can be used to swap the names of two MySQL databases (**<db1>** and **<db2>**):

```
mysqladmin -uroot -p<password> create swaptmp
mysqldump -uroot -p<password> --routines <db1> | mysql -uroot -p<password> swaptmp
mysqladmin -uroot -p<password> drop <db1>
mysqladmin -uroot -p<password> create <db1>
mysqldump -uroot -p<password> --routines <db2> | mysql -uroot -p<password> <db1>
mysqladmin -uroot -p<password> drop <db2>
mysqladmin -uroot -p<password> create <db2>
mysqldump -uroot -p<password> --routines swaptmp | mysql -uroot -p<password> <db2>
mysqladmin -uroot -p<password> drop swaptmp
```

Steps:

1. Copy the lines above into a text editor.
2. Replace all references to **<db1>**, **<db2>** and **<password>** (+ optionally root to use a different user) with the relevant values.
3. Execute one by one on the command line (assuming the MySQL "bin" folder is in the path and entering "y" when prompted).

Section 26.10: Renaming a column in a MySQL table

Renaming a column can be done in a single statement but as well as the new name, the "column definition" (i.e. its data type and other optional properties such as nullability, auto incrementing etc.) must also be specified.

```
ALTER TABLE `<table name>` CHANGE `<old name>` `<new name>` <column definition>;
```

Steps:

1. Open the MySQL command line or a client such as MySQL Workbench.
2. Run the following statement: **SHOW CREATE TABLE** **<table name>**; (replacing **<table name>** with the relevant value).
3. Make a note of the entire column definition for the column to be renamed (*i.e. everything that appears after the name of the column but before the comma separating it from the next column name*).
4. Replace **<old name>**, **<new name>** and **<column definition>** in the line above with the relevant values and then execute it.

Chapter 27: Drop Table

Parameters

TEMPORARY Optional. It specifies that only temporary tables should be dropped by the DROP TABLE statement.

IF EXISTS Optional. If specified, the DROP TABLE statement will not raise an error if one of the tables does not exist.

Details

Section 27.1: Drop Table

Drop Table is used to delete the table from database.

Creating Table:

Creating a table named tbl and then deleting the created table

```
CREATE TABLE tbl(  
  id INT NOT NULL AUTO_INCREMENT,  
  title VARCHAR(100) NOT NULL,  
  author VARCHAR(40) NOT NULL,  
  submission_date DATE,  
  PRIMARY KEY (id)  
);
```

Dropping Table:

```
DROP TABLE tbl;
```

PLEASE NOTE

Dropping table will completely delete the table from the database and all its information, and it will not be recovered.

Section 27.2: Drop tables from database

```
DROP TABLE Database.table_name
```

Chapter 28: MySQL LOCK TABLE

Section 28.1: Row Level Locking

If the tables use InnoDB, MySQL automatically uses row level locking so that multiple transactions can use same table simultaneously for read and write, without making each other wait.

If two transactions trying to modify the same row and both uses row level locking, one of the transactions waits for the other to complete.

Row level locking also can be obtained by using **SELECT ... FOR UPDATE** statement for each rows expected to be modified.

Consider two connections to explain Row level locking in detail

Connection 1

```
START TRANSACTION;  
SELECT ledgerAmount FROM accDetails WHERE id = 1 FOR UPDATE;
```

In connection 1, row level lock obtained by **SELECT ... FOR UPDATE** statement.

Connection 2

```
UPDATE accDetails SET ledgerAmount = ledgerAmount + 500 WHERE id=1;
```

When some one try to update same row in connection 2, that will wait for connection 1 to finish transaction or error message will be displayed according to the `innodb_lock_wait_timeout` setting, which defaults to 50 seconds.

```
Error Code: 1205. Lock wait timeout exceeded; try restarting transaction
```

To view details about this lock, run **SHOW ENGINE INNODB STATUS**

```
---TRANSACTION 1973004, ACTIVE 7 sec updating  
mysql tables in use 1, locked 1  
LOCK WAIT 2 lock struct(s), heap size 360, 1 row lock(s)  
MySQL thread id 4, OS thread handle 0x7f996beac700, query id 30 localhost root update  
UPDATE accDetails SET ledgerAmount = ledgerAmount + 500 WHERE id=1  
----- TRX HAS BEEN WAITING 7 SEC FOR THIS LOCK TO BE GRANTED:
```

Connection 2

```
UPDATE accDetails SET ledgerAmount = ledgerAmount + 250 WHERE id=2;
```

```
1 row(s) affected
```

But while updating some other row in connection 2 will be executed without any error.

Connection 1

```
UPDATE accDetails SET ledgerAmount = ledgerAmount + 750 WHERE id=1;  
COMMIT;
```

```
1 row(s) affected
```

Now row lock is released, because transaction is committed in Connection 1.

Connection 2

```
UPDATE accDetails SET ledgerAmount = ledgerAmount + 500 WHERE id=1;
```

```
1 row(s) affected
```

The update is executed without any error in Connection 2 after Connection 1 released row lock by finishing the transaction.

Section 28.2: Mysql Locks

*Table locks can be an important tool for **ENGINE=MyISAM**, but are rarely useful for **ENGINE=InnoDB**. If you are tempted to use table locks with InnoDB, you should rethink how you are working with transactions.*

MySQL enables client sessions to acquire table locks explicitly for the purpose of cooperating with other sessions for access to tables, or to prevent other sessions from modifying tables during periods when a session requires exclusive access to them. A session can acquire or release locks only for itself. One session cannot acquire locks for another session or release locks held by another session.

Locks may be used to emulate transactions or to get more speed when updating tables. This is explained in more detail later in this section.

Command: **LOCK TABLES** table_name **READ|WRITE**;

you can assign only lock type to a single table;

Example (READ LOCK):

```
LOCK TABLES table_name READ;
```

Example (WRITE LOCK):

```
LOCK TABLES table_name WRITE;
```

To see lock is applied or not, use following Command

```
SHOW OPEN TABLES;
```

To flush/remove all locks, use following command:

```
UNLOCK TABLES;
```

EXAMPLE:

```
LOCK TABLES products WRITE;  
INSERT INTO products(id,product_name) SELECT id,old_product_name FROM old_products;  
UNLOCK TABLES;
```

Above example any external connection cannot write any data to products table until unlocking table product

EXAMPLE:

```
LOCK TABLES products READ;  
INSERT INTO products(id,product_name) SELECT id,old_product_name FROM old_products;  
UNLOCK TABLES;
```

Above example any external connection cannot read any data from products table until unlocking table product

Chapter 29: Error codes

Section 29.1: Error code 1064: Syntax error

```
select LastName, FirstName,  
from Person
```

Returns message:

Error Code: 1064. You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'from Person' at line 2.

Getting a "1064 error" message from MySQL means the query cannot be parsed without syntax errors. In other words it can't make sense of the query.

The quotation in the error message begins with the first character of the query that MySQL can't figure out how to parse. In this example MySQL can't make sense, in context, of **from** Person. In this case, there's an extra comma immediately before **from** Person. The comma tells MySQL to expect another column description in the **SELECT** clause

A syntax error always says ... near '...'. The thing at the beginning of the quotes is very near where the error is. To locate an error, look at the first token in the quotes and at the last token before the quotes.

Sometimes you will get ... near ''; that is, nothing in the quotes. That means the first character MySQL can't figure out is right at the end or the beginning of the statement. This suggests the query contains unbalanced quotes (' or ") or unbalanced parentheses or that you did not terminate the statement before correctly.

In the case of a Stored Routine, you may have forgotten to properly use DELIMITER.

So, when you get Error 1064, look at the text of the query, and find the point mentioned in the error message. Visually inspect the text of the query right around that point.

If you ask somebody to help you troubleshoot Error 1064, it's best to provide both the text of the whole query and the text of the error message.

Section 29.2: Error code 1175: Safe Update

This error appears while trying to update or delete records without including the **WHERE** clause that uses the **KEY** column.

To execute the delete or update anyway - type:

```
SET SQL_SAFE_UPDATES = 0;
```

To enable the safe mode again - type:

```
SET SQL_SAFE_UPDATES = 1;
```

Section 29.3: Error code 1215: Cannot add foreign key

constraint

This error occurs when tables are not adequately structured to handle the speedy lookup verification of Foreign Key (FK) requirements that the developer is mandating.

```
CREATE TABLE `gtType` (  
  `type` char(2) NOT NULL,  
  `description` varchar(1000) NOT NULL,  
  PRIMARY KEY (`type`)  
) ENGINE=InnoDB;  
  
CREATE TABLE `getTogethers` (  
  `id` int(11) NOT NULL AUTO_INCREMENT,  
  `type` char(2) NOT NULL,  
  `eventDT` datetime NOT NULL,  
  `location` varchar(1000) NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `fk_gt2type` (`type`), -- see Note1 below  
  CONSTRAINT `gettogethers_ibfk_1` FOREIGN KEY (`type`) REFERENCES `gtType` (`type`)  
) ENGINE=InnoDB;
```

Note1: a KEY like this will be created automatically if needed due to the FK definition in the line that follows it. The developer can skip it, and the KEY (a.k.a. index) will be added if necessary. An example of it being skipped by the developer is shown below in someOther.

So far so good, until the below call.

```
CREATE TABLE `someOther` (  
  `id` int(11) NOT NULL AUTO_INCREMENT,  
  `someDT` datetime NOT NULL,  
  PRIMARY KEY (`id`),  
  CONSTRAINT `someOther_dt` FOREIGN KEY (`someDT`) REFERENCES `getTogethers` (`eventDT`)  
) ENGINE=InnoDB;
```

Error Code: 1215. Cannot add foreign key constraint

In this case it fails due to the lack of an index in the *referenced* table getTogethers to handle the speedy lookup of an eventDT. To be solved in next statement.

```
CREATE INDEX `gt_eventdt` ON getTogethers (`eventDT`);
```

Table getTogethers has been modified, and now the creation of someOther will succeed.

From the MySQL Manual Page [Using FOREIGN KEY Constraints](#):

MySQL requires indexes on foreign keys and referenced keys so that foreign key checks can be fast and not require a table scan. In the referencing table, there must be an index where the foreign key columns are listed as the first columns in the same order. Such an index is created on the referencing table automatically if it does not exist.

Corresponding columns in the foreign key and the referenced key must have similar data types. The size and sign of integer types must be the same. The length of string types need not be the same. For nonbinary (character) string columns, the character set and collation must be the same.

InnoDB permits a foreign key to reference any index column or group of columns. However, in the referenced table, there must be an index where the referenced columns are listed as the first columns in the same order.

Note that last point above about first (left-most) columns and the lack of a Primary Key requirement (though highly advised).

Upon successful creation of a *referencing* (child) table, any keys that were automatically created for you are visible with a command such as the following:

```
SHOW CREATE TABLE someOther;
```

Other common cases of experiencing this error include, as mentioned above from the docs, but should be highlighted:

- Seemingly trivial differences in **INT** which is signed, pointing toward **INT UNSIGNED**.
- Developers having trouble understanding multi-column (composite) KEYS and first (left-most) ordering requirements.

Section 29.4: 1067, 1292, 1366, 1411 - Bad Value for number, date, default, etc

1067 This is probably related to **TIMESTAMP** defaults, which have changed over time. See **TIMESTAMP** defaults in the Dates & Times page. (which does not exist yet)

1292/1366 DOUBLE/Integer Check for letters or other syntax errors. Check that the columns align; perhaps you think you are putting into a **VARCHAR** but it is aligned with a numeric column.

1292 DATETIME Check for too far in past or future. Check for between 2am and 3am on a morning when Daylight savings changed. Check for bad syntax, such as **+00** timezone stuff.

1292 VARIABLE Check the allowed values for the VARIABLE you are trying to **SET**.

1292 LOAD DATA Look at the line that is 'bad'. Check the escape symbols, etc. Look at the datatypes.

1411 STR_TO_DATE Incorrectly formatted date?

Section 29.5: 1045 Access denied

See discussions in "GRANT" and "Recovering root password".

Section 29.6: 1236 "impossible position" in Replication

Usually this means that the Master crashed and that sync_binlog was OFF. The solution is to **CHANGE MASTER to POS=0** of the next binlog file (see the Master) on the Slave.

The cause: The Master sends replication items to the Slave before flushing to its binlog (when sync_binlog=OFF). If the Master crashes before the flush, the Slave has already logically moved past the end of file on the binlog. When the Master starts up again, it starts a new binlog, so CHANGing to the beginning of that binlog is the best available solution.

A longer term solution is sync_binlog=ON, if you can afford the extra I/O that it causes.

(If you are running with GTID, ...?)

Section 29.7: 2002, 2003 Cannot connect

Check for a Firewall issue blocking port 3306.

Some possible diagnostics and/or solutions

- Is the server actually running?
- "service firewalld stop" and "systemctl disable firewalld"
- telnet master 3306
- Check the bind-address
- check skip-name-resolve
- check the socket.

Section 29.8: 126, 127, 134, 144, 145

When you try access the records from MySQL database, you may get these error messages. These error messages occurred due to corruption in MySQL database. Following are the types

```
MySQL error code 126 = Index file is crashed
MySQL error code 127 = Record-file is crashed
MySQL error code 134 = Record was already deleted (or record file crashed)
MySQL error code 144 = Table is crashed and last repair failed
MySQL error code 145 = Table was marked as crashed and should be repaired
```

MySQL bug, virus attack, server crash, improper shutdown, damaged table are the reason behind this corruption. When it gets corrupted, it becomes inaccessible and you cannot access them anymore. In order to get accessibility, the best way to retrieve data from an updated backup. However, if you do not have updated or any valid backup then you can go for MySQL Repair.

If the table engine type is MyISAM, apply **CHECK TABLE**, then **REPAIR TABLE** to it.

Then think seriously about converting to InnoDB, so this error won't happen again.

Syntax

```
CHECK TABLE <table name> ////To check the extent of database corruption
REPAIR TABLE <table name> ////To repair table
```

Section 29.9: 139

Error 139 may mean that the number and size of the fields in the table definition exceeds some limit. Workarounds:

- Re-think the schema
- Normalize some fields
- Vertically partition the table

Section 29.10: 1366

This usually means that the character set handling was not consistent between client and server. See ... for further assistance.

Section 29.11: 126, 1054, 1146, 1062, 24

(taking a break) With the inclusion of those 4 error numbers, I think this page will have covered about 50% of the typical errors users get.

(Yes, this 'Example' needs revision.)

24 Can't open file (Too many open files)

`open_files_limit` comes from an OS setting. `table_open_cache` needs to be less than that.

These can cause that error:

- Failure to **DEALLOCATE PREPARE** in a stored procedure.
- PARTITIONed table(s) with a large number of partitions and `innodb_file_per_table = ON`. Recommend not having more than 50 partitions in a given table (for various reasons). (When "Native Partitions" become available, this advice may change.)

The obvious workaround is to set increase the OS limit: To allow more files, change `ulimit` or `/etc/security/limits.conf` or in `sysctl.conf` (`kern.maxfiles` & `kern.maxfilesperproc`) or something else (OS dependent). Then increase `open_files_limit` and `table_open_cache`.

As of 5.6.8, `open_files_limit` is auto-sized based on `max_connections`, but it is OK to change it from the default.

1062 - Duplicate Entry

This error occur mainly because of the following two reasons

1. *Duplicate Value* - Error Code: **1062**. Duplicate entry '12' for **key** 'PRIMARY'

The primary key column is unique and it will not accept the duplicate entry. So when you are trying to insert a new row which is already present in you table will produce this error.

To solve this, Set the primary key column as **AUTO_INCREMENT**. And when you are trying to insert a new row, ignore the primary key column or insert **NULL** value to primary key.

```
CREATE TABLE userDetails(  
  userId INT(10) NOT NULL AUTO_INCREMENT,  
  firstName VARCHAR(50),  
  lastName VARCHAR(50),  
  isActive INT(1) DEFAULT 0,  
  PRIMARY KEY (userId) );  
  
--->and now while inserting  
INSERT INTO userDetails VALUES (NULL , 'John', 'Doe', 1);
```

2. *Unique data field* - Error Code: **1062**. Duplicate entry 'A' for **key** 'code'

You may assigned a column as unique and trying to insert a new row with already existing value for that column will produce this error.

To overcome this error, use **INSERT IGNORE** instead of normal **INSERT**. If the new row which you are trying to insert doesn't duplicate an existing record, MySQL inserts it as usual. If the record is a duplicate, the **IGNORE** keyword discard it without generating any error.

```
INSERT IGNORE INTO userDetails VALUES (NULL , 'John', 'Doe', 1);
```

Chapter 30: Stored routines (procedures and functions)

Parameter

Details

RETURNS Specifies the data type that can be returned from a function.

RETURN Actual variable or value following the RETURN syntax is what is returned to where the function was called from.

Section 30.1: Stored procedure with IN, OUT, INOUT parameters

```
DELIMITER $$

DROP PROCEDURE IF EXISTS sp_nested_loop$$
CREATE PROCEDURE sp_nested_loop(IN i INT, IN j INT, OUT x INT, OUT y INT, INOUT z INT)
BEGIN
    DECLARE a INTEGER DEFAULT 0;
    DECLARE b INTEGER DEFAULT 0;
    DECLARE c INTEGER DEFAULT 0;
    WHILE a < i DO
        WHILE b < j DO
            SET c = c + 1;
            SET b = b + 1;
        END WHILE;
        SET a = a + 1;
        SET b = 0;
    END WHILE;
    SET x = a, y = c;
    SET z = x + y + z;
END $$
DELIMITER ;
```

Invokes ([CALL](#)) the stored procedure:

```
SET @z = 30;
call sp_nested_loop(10, 20, @x, @y, @z);
SELECT @x, @y, @z;
```

Result:

@x	@y	@z
10	200	240

An **IN** parameter passes a value into a procedure. The procedure might modify the value, but the modification is not visible to the caller when the procedure returns.

An **OUT** parameter passes a value from the procedure back to the caller. Its initial value is NULL within the procedure, and its value is visible to the caller when the procedure returns.

An **INOUT** parameter is initialized by the caller, can be modified by the procedure, and any change made by the procedure is visible to the caller when the procedure returns.

Section 30.2: Create a Function

The following (trivial) example function simply returns the constant **INT** value 12.

```
DELIMITER ||
CREATE FUNCTION functionname()
RETURNS INT
BEGIN
    RETURN 12;
END;
||
DELIMITER ;
```

The first line defines what the delimiter character(**DELIMITER ||**) is to be changed to, this is needed to be set before a function is created otherwise if left it at its default **;** then the first **;** that is found in the function body will be taken as the end of the **CREATE** statement, which is usually not what is desired.

After the **CREATE FUNCTION** has run you should set the delimiter back to its default of **;** as is seen after the function code in the above example (**DELIMITER ;**).

Execution this function is as follows:

```
SELECT functionname();
```

```
+-----+
| functionname() |
+-----+
|          12    |
+-----+
```

A slightly more complex (but still trivial) example takes a parameter and adds a constant to it:

```
DELIMITER $$
CREATE FUNCTION add_2 ( my_arg INT )
RETURNS INT
BEGIN
    RETURN (my_arg + 2);
END;
$$
DELIMITER ;
```

```
SELECT add_2(12);
+-----+
| add_2(12) |
+-----+
|         14 |
+-----+
```

Note the use of a different argument to the **DELIMITER** directive. You can actually use any character sequence that does not appear in the **CREATE** statement body, but the usual practice is to use a doubled non-alphanumeric character such as ****, **||** or **\$\$**.

It is good practice to always change the parameter before and after a function, procedure or trigger creation or update as some GUI's don't require the delimiter to change whereas running queries via the command line always require the delimiter to be set.

Section 30.3: Cursors

Cursors enable you to iterate results of query one by line. **DECLARE** command is used to init cursor and associate it with a specific SQL query:

```
DECLARE student CURSOR FOR SELECT name FROM student;
```

Let's say we sell products of some types. We want to count how many products of each type are exists.

Our data:

```
CREATE TABLE product
(
  id    INT(10) UNSIGNED NOT NULL AUTO_INCREMENT PRIMARY KEY,
  type  VARCHAR(50) NOT NULL,
  name  VARCHAR(255) NOT NULL
);
CREATE TABLE product_type
(
  name VARCHAR(50) NOT NULL PRIMARY KEY
);
CREATE TABLE product_type_count
(
  type  VARCHAR(50) NOT NULL PRIMARY KEY,
  count INT(10) UNSIGNED NOT NULL DEFAULT 0
);

INSERT INTO product_type (name) VALUES
('dress'),
('food');

INSERT INTO product (type, name) VALUES
('dress', 'T-shirt'),
('dress', 'Trousers'),
('food', 'Apple'),
('food', 'Tomatoes'),
('food', 'Meat');
```

We may achieve the goal using stored procedure with using cursor:

```
DELIMITER //
DROP PROCEDURE IF EXISTS product_count;
CREATE PROCEDURE product_count()
BEGIN
  DECLARE p_type VARCHAR(255);
  DECLARE p_count INT(10) UNSIGNED;
  DECLARE done INT DEFAULT 0;
  DECLARE product CURSOR FOR
    SELECT
      type,
      COUNT(*)
    FROM product
    GROUP BY type;
  DECLARE CONTINUE HANDLER FOR SQLSTATE '02000' SET done = 1;

  TRUNCATE product_type;

  OPEN product;
```

```

REPEAT
  FETCH product
  INTO p_type, p_count;
  IF NOT done
  THEN
    INSERT INTO product_type_count
    SET
      type = p_type,
      count = p_count;
  END IF;
UNTIL done
END REPEAT;

CLOSE product;
END //
DELIMITER ;

```

When you may call procedure with:

```
CALL product_count();
```

Result would be in product_type_count table:

type	count
dress	2
food	3

While that is a good example of a CURSOR, notice how the entire body of the procedure can be replaced by just

```

INSERT INTO product_type_count
  (type, count)
SELECT type, COUNT(*)
FROM product
GROUP BY type;

```

This will run a lot faster.

Section 30.4: Multiple ResultSets

Unlike a **SELECT** statement, a Stored **Procedure** returns multiple result sets. The requires different code to be used for gathering the results of a **CALL** in Perl, PHP, etc.

(Need specific code here or elsewhere!)

Section 30.5: Create a function

```

DELIMITER $$
CREATE
  DEFINER=`db_username`@`hostname_or_IP`
  FUNCTION `function_name` (optional_param data_type(length_if_applicable))
  RETURNS data_type
BEGIN
  /*
  SQL Statements goes here
  */
END$$

```

```
DELIMITER ;
```

The RETURNS data_type is any MySQL datatype.

Chapter 31: Indexes and Keys

Section 31.1: Create index

```
-- Create an index for column 'name' in table 'my_table'  
CREATE INDEX idx_name ON my_table(name);
```

Section 31.2: Create unique index

A unique index prevents the insertion of duplicated data in a table. **NULL** values can be inserted in the columns that form part of the unique index (since, by definition, a **NULL** value is different from any other value, including another **NULL** value)

```
-- Creates a unique index for column 'name' in table 'my_table'  
CREATE UNIQUE INDEX idx_name ON my_table(name);
```

Section 31.3: AUTO_INCREMENT key

```
CREATE TABLE (  
    id INT UNSIGNED NOT NULL AUTO_INCREMENT,  
    ...  
    PRIMARY KEY(id),  
    ... );
```

Main notes:

- Starts with 1 and increments by 1 automatically when you fail to specify it on **INSERT**, or specify it as **NULL**.
- The ids are always distinct from each other, but...
- Do not make any assumptions (no gaps, consecutively generated, not reused, etc) about the values of the id other than being unique at any given instant.

Subtle notes:

- On restart of server, the 'next' value is 'computed' as **MAX(id)+1**.
- If the last operation before shutdown or crash was to delete the highest id, that id *may* be reused (this is engine-dependent). So, *do not trust auto_increments to be permanently unique*; they are only unique at any moment.
- For multi-master or clustered solutions, see **auto_increment_offset** and **auto_increment_increment**.
- It is OK to have something else as the **PRIMARY KEY** and simply do **INDEX(id)**. (This is an optimization in some situations.)
- Using the **AUTO_INCREMENT** as the "**PARTITION** key" is rarely beneficial; do something different.
- Various operations *may* "burn" values. This happens when they pre-allocate value(s), then don't use them: **INSERT IGNORE** (with dup key), **REPLACE** (which is **DELETE** plus **INSERT**) and others. **ROLLBACK** is another cause for gaps in ids.
- In Replication, you cannot trust ids to arrive at the slave(s) in ascending order. Although ids are assigned in consecutive order, InnoDB statements are sent to slaves in **COMMIT** order.

Section 31.4: Create composite index

This will create a composite index of both keys, **mystring** and **mydatetime** and speed up queries with both columns in the **WHERE** clause.

```
CREATE INDEX idx_mycol_myothercol ON my_table(mycol, myothercol)
```

Note: The order is important! If the search query does not include both columns in the **WHERE** clause, it can only use the leftmost index. In this case, a query with mycol in the **WHERE** will use the index, a query searching for myothercol **without** also searching for mycol will **not**. For more information [check out this blog post](#).

Note: Due to the way BTREE's work, columns that are usually queried in ranges should go in the rightmost value. For example, **DATETIME** columns are usually queried like **WHERE** datecol > '2016-01-01 00:00:00'. BTREE indexes handle ranges very efficiently but only if the column being queried as a range is the last one in the composite index.

Section 31.5: Drop index

```
-- Drop an index for column 'name' in table 'my_table'  
DROP INDEX idx_name ON my_table;
```

Chapter 32: Full-Text search

MySQL offers FULLTEXT searching. It searches tables with columns containing text for the best matches for words and phrases.

Section 32.1: Simple FULLTEXT search

```
SET @searchTerm= 'Database Programming';
SELECT MATCH (Title) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE) Score,
       ISBN, Author, Title
FROM book
WHERE MATCH (Title) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE)
ORDER BY MATCH (Title) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE) DESC;
```

Given a table named `book` with columns named `ISBN`, `Title`, and `Author`, this finds books matching the terms `'Database Programming'`. It shows the best matches first.

For this to work, a fulltext index on the `Title` column must be available:

```
ALTER TABLE book ADD FULLTEXT INDEX Fulltext_title_index (Title);
```

Section 32.2: Simple BOOLEAN search

```
SET @searchTerm= 'Database Programming -Java';
SELECT MATCH (Title) AGAINST (@searchTerm IN BOOLEAN MODE) Score,
       ISBN, Author, Title
FROM book
WHERE MATCH (Title) AGAINST (@searchTerm IN BOOLEAN MODE)
ORDER BY MATCH (Title) AGAINST (@searchTerm IN BOOLEAN MODE) DESC;
```

Given a table named `book` with columns named `ISBN`, `Title`, and `Author`, this searches for books with the words `'Database'` and `'Programming'` in the title, but not the word `'Java'`.

For this to work, a fulltext index on the `Title` column must be available:

```
ALTER TABLE book ADD FULLTEXT INDEX Fulltext_title_index (Title);
```

Section 32.3: Multi-column FULLTEXT search

```
SET @searchTerm= 'Date Database Programming';
SELECT MATCH (Title, Author) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE) Score,
       ISBN, Author, Title
FROM book
WHERE MATCH (Title, Author) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE)
ORDER BY MATCH (Title, Author) AGAINST (@searchTerm IN NATURAL LANGUAGE MODE) DESC;
```

Given a table named `book` with columns named `ISBN`, `Title`, and `Author`, this finds books matching the terms `'Date Database Programming'`. It shows the best matches first. The best matches include books written by Prof. C. J. Date.

(But, one of the best matches is also *The Date Doctor's Guide to Dating: How to Get from First Date to Perfect Mate*. This shows up a limitation of FULLTEXT search: it doesn't pretend to understand such things as parts of speech or the meaning of the indexed words.)

For this to work, a fulltext index on the `Title` and `Author` columns must be available:

```
ALTER TABLE book ADD FULLTEXT INDEX Fulltext_title_author_index (Title, Author);
```

Chapter 33: PREPARE Statements

Section 33.1: PREPARE, EXECUTE and DEALLOCATE PREPARE Statements

[PREPARE](#) prepares a statement for execution

[EXECUTE](#) executes a prepared statement

[DEALLOCATE PREPARE](#) releases a prepared statement

```
SET @s = 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
PREPARE stmt2 FROM @s;
SET @a = 6;
SET @b = 8;
EXECUTE stmt2 USING @a, @b;
```

Result:

```
+-----+
| hypotenuse |
+-----+
|          10 |
+-----+
```

Finally,

```
DEALLOCATE PREPARE stmt2;
```

Notes:

- You must use @variables, not DECLARED variables for **FROM** @s
- A primary use for Prepare, etc, is to 'construct' a query for situations where binding will not work, such as inserting the table name.

Section 33.2: Alter table with add column

```
SET v_column_definition := CONCAT(
    v_column_name
    , ' ', v_column_type
    , ' ', v_column_options
);

SET @stmt := CONCAT('ALTER TABLE ADD COLUMN ', v_column_definition);

PREPARE stmt FROM @stmt;
EXECUTE stmt;
DEALLOCATE PREPARE stmt;
```

Chapter 34: JSON

As of MySQL 5.7.8, MySQL supports a native JSON data type that enables efficient access to data in JSON (JavaScript Object Notation) documents. <https://dev.mysql.com/doc/refman/5.7/en/json.html>

Section 34.1: Create simple table with a primary key and JSON field

```
CREATE TABLE table_name (  
    id INT NOT NULL AUTO_INCREMENT,  
    json_col JSON,  
    PRIMARY KEY(id)  
);
```

Section 34.2: Insert a simple JSON

```
INSERT INTO  
    table_name (json_col)  
VALUES  
    ('{"City": "Galle", "Description": "Best damn city in the world"}');
```

That's simple as it can get but note that because JSON dictionary keys have to be surrounded by double quotes the entire thing should be wrapped in single quotes. If the query succeeds, the data will be stored in a binary format.

Section 34.3: Updating a JSON field

In the previous example we saw how mixed data types can be inserted into a JSON field. What if we want to update that field? We are going to add *scheveningen* to the array named *variations* in the previous example.

```
UPDATE  
    myjson  
SET  
    dict=JSON_ARRAY_APPEND(dict,'$.variations','scheveningen')  
WHERE  
    id = 2;
```

Notes:

1. The `$.variations` array in our json dictionary. The `$` symbol represents the json documentation. For a full explanation of json paths recognized by mysql refer to <https://dev.mysql.com/doc/refman/5.7/en/json-path-syntax.html>
2. Since we don't yet have an example on querying using json fields, this example uses the primary key.

Now if we do `SELECT * FROM myjson` we will see

```
+-----+-----+  
| id | dict |  
+-----+-----+  
| 2 | {"opening": "Sicilian", "variations": ["pelikan", "dragon", "najdorf", "scheveningen"]} |  
+-----+-----+  
1 row in set (0.00 sec)
```

Section 34.4: Insert mixed data into a JSON field

This inserts a json dictionary where one of the members is an array of strings into the table that was created in another example.

```
INSERT INTO myjson(dict)
VALUES('{"opening":"Sicilian","variations":["pelikan","dragon","najdorf"]}');
```

Note, once again, that you need to be careful with the use of single and double quotes. The whole thing has to be wrapped in single quotes.

Section 34.5: CAST data to JSON type

This converts valid json strings to MySQL JSON type:

```
SELECT CAST('[1,2,3]' as JSON) ;
SELECT CAST('{"opening":"Sicilian","variations":["pelikan","dragon","najdorf"]} ' as JSON);
```

Section 34.6: Create Json Object and Array

JSON_OBJECT creates JSON Objects:

```
SELECT JSON_OBJECT('key1',col1 , 'key2',col2 , 'key3','col3') as myobj;
```

JSON_ARRAY creates JSON Array as well:

```
SELECT JSON_ARRAY(col1,col2,'col3') as myarray;
```

Note: myobj.key3 and myarray[2] are "col3" as fixed string.

Also mixed JSON data:

```
SELECT JSON_OBJECT("opening","Sicilian", "variations",JSON_ARRAY("pelikan","dragon","najdorf"))
as mymixed ;
```

Chapter 35: Extract values from JSON type

Parameter	Description
json_doc	valid JSON document
path	members path

MySQL 5.7.8+ supports native JSON type. While you have different ways to create json objects, you can access and read members in different ways, too.

Main function is JSON_EXTRACT, hence `->` and `->>` operators are more friendly.

Section 35.1: Read JSON Array value

Create @myjson variable as JSON type (read more):

```
SET @myjson = CAST('["A","B",{ "id":1, "label":"C"}]' as JSON) ;
```

SELECT some members!

```
SELECT
  JSON_EXTRACT( @myjson , '$[1]' ) ,
  JSON_EXTRACT( @myjson , '$[*].label' ) ,
  JSON_EXTRACT( @myjson , '$[1].*' ) ,
  JSON_EXTRACT( @myjson , '$[2].*' )
;
-- result values:
'\\"B\\"', '[\\"C\\"]', NULL, '[1, \\"C\\"]'
-- visually:
"B", ["C"], NULL, [1, "C"]
```

Section 35.2: JSON Extract Operators

Extract path by `->` or `->>` Operators, while `->>` is UNQUOTED value:

```
SELECT
  myjson_col->'${1}' , myjson_col->'${1}' ,
  myjson_col->'${[*].label' ,
  myjson_col->'${[1].*' ,
  myjson_col->'${[2].*'
FROM tablename ;
-- visuell:
B, "B" , ["C"], NULL, [1, "C"]
--^^^ ^^^
```

So `col->>path` is equal to `JSON_UNQUOTE(JSON_EXTRACT(col,path))` :

As with `->`, the `->>` operator is always expanded in the output of EXPLAIN, as the following example demonstrates:

```
mysql> EXPLAIN SELECT c->>'$.name' AS name
->      FROM jemp WHERE g > 2\G
***** 1. row *****
id: 1
```

```
select_type: SIMPLE
table: jemp
partitions: NULL
type: range
possible_keys: i
key: i
key_len: 5
ref: NULL
rows: 2
filtered: 100.00
Extra: Using where
1 row in set, 1 warning (0.00 sec)
```

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Note
Code: 1003
Message: /* select#1 */ select
json_unquote(json_extract(`jtest`.`jemp`.`c`, '$.name')) AS `name` from
`jtest`.`jemp` where (`jtest`.`jemp`.`g` > 2)
1 row in set (0.00 sec)
```

Read about [inline path extract\(+\)](#)

Chapter 36: MySQL Admin

Section 36.1: Atomic RENAME & Table Reload

```
RENAME TABLE t TO t_old, t_copy TO t;
```

No other sessions can access the tables involved while RENAME TABLE executes, so the rename operation is not subject to concurrency problems.

Atomic Rename is especially for completely reloading a table without waiting for **DELETE** and load to finish:

```
CREATE TABLE new LIKE real;  
load `new` by whatever means - LOAD DATA, INSERT, whatever  
RENAME TABLE real TO old, new TO real;  
DROP TABLE old;
```

Section 36.2: Change root password

```
mysqladmin -u root -p'old-password' password 'new-password'
```

Section 36.3: Drop database

Useful for scripting to drop all tables and deletes the database:

```
mysqladmin -u[username] -p[password] drop [database]
```

Use with extreme caution.

To **DROP** database as a SQL Script (you will need DROP privilege on that database):

```
DROP DATABASE database_name
```

or

```
DROP SCHEMA database_name
```

Chapter 37: TRIGGERS

Section 37.1: Basic Trigger

Create Table

```
mysql> CREATE TABLE account (acct_num INT, amount DECIMAL(10,2));
```

Query OK, 0 rows affected (0.03 sec)

Create Trigger

```
mysql> CREATE TRIGGER ins_sum BEFORE INSERT ON account
-> FOR EACH ROW SET @sum = @sum + NEW.amount;
```

Query OK, 0 rows affected (0.06 sec)

The CREATE TRIGGER statement creates a trigger named ins_sum that is associated with the account table. It also includes clauses that specify the trigger action time, the triggering event, and what to do when the trigger activates

Insert Value

To use the trigger, set the accumulator variable (@sum) to zero, execute an INSERT statement, and then see what value the variable has afterward:

```
mysql> SET @sum = 0;
mysql> INSERT INTO account VALUES(137, 14.98), (141, 1937.50), (97, -100.00);
mysql> SELECT @sum AS 'Total amount inserted';
```

```
+-----+
| Total amount inserted |
+-----+
| 1852.48                |
+-----+
```

In this case, the value of @sum after the INSERT statement has executed is 14.98 + 1937.50 - 100, or 1852.48.

Drop Trigger

```
mysql> DROP TRIGGER test.ins_sum;
```

If you drop a table, any triggers for the table are also dropped.

Section 37.2: Types of triggers

Timing

There are two trigger action time modifiers :

- BEFORE trigger activates before executing the request,
- AFTER trigger fire after change.

Triggering event

There are three events that triggers can be attached to:

- **INSERT**
- **UPDATE**
- **DELETE**

Before Insert trigger example

```
DELIMITER $$

CREATE TRIGGER insert_date
  BEFORE INSERT ON stack
  FOR EACH ROW
BEGIN
  -- set the insert_date field in the request before the insert
  SET NEW.insert_date = NOW();
END;

$$
DELIMITER ;
```

Before Update trigger example

```
DELIMITER $$

CREATE TRIGGER update_date
  BEFORE UPDATE ON stack
  FOR EACH ROW
BEGIN
  -- set the update_date field in the request before the update
  SET NEW.update_date = NOW();
END;

$$
DELIMITER ;
```

After Delete trigger example

```
DELIMITER $$

CREATE TRIGGER deletion_date
  AFTER DELETE ON stack
  FOR EACH ROW
BEGIN
  -- add a log entry after a successful delete
  INSERT INTO log_action(stack_id, deleted_date) VALUES(OLD.id, NOW());
END;

$$
DELIMITER ;
```

Chapter 38: Configuration and tuning

Section 38.1: InnoDB performance

There are hundreds of settings that can be placed in my.cnf. For the 'lite' user of MySQL, they won't matter as much.

Once your database becomes non-trivial, it is advisable to set the following parameters:

```
innodb_buffer_pool_size
```

This should be set to about 70% of *available* RAM (if you have at least 4GB of RAM; a smaller percentage if you have a tiny VM or antique machine). The setting controls the amount of cache used by the InnoDB ENGINE. Hence, it is very important for performance of InnoDB.

Section 38.2: Parameter to allow huge data to insert

If you need to store images or videos in the column then we need to change the value as needed by your application

```
max_allowed_packet = 10M
```

M is Mb, G in Gb, K in Kb

Section 38.3: Increase the string limit for group_concat

`group_concat` is used to concatenate non-null values in a group. The maximum length of the resulting string can be set using the `group_concat_max_len` option:

```
SET [GLOBAL | SESSION] group_concat_max_len = val;
```

Setting the **GLOBAL** variable will ensure a permanent change, whereas setting the **SESSION** variable will set the value for the current session.

Section 38.4: Minimal InnoDB configuration

This is a bare minimum setup for MySQL servers using InnoDB tables. Using InnoDB, query cache is not required. Reclaim disk space when a table or database is **DROP**ed. If you're using SSDs, flushing is a redundant operation (SSDs are not sequential).

```
default_storage_engine = InnoDB
query_cache_type = 0
innodb_file_per_table = 1
innodb_flush_neighbors = 0
```

Concurrency

Make sure we can create more than the default 4 threads by setting `innodb_thread_concurrency` to infinity (0); this lets InnoDB decide based on optimal execution.

```
innodb_thread_concurrency = 0
innodb_read_io_threads = 64
innodb_write_io_threads = 64
```

Hard drive utilization

Set the capacity (normal load) and capacity_max (absolute maximum) of IOPS for MySQL. The default of 200 is fine for HDDs, but these days, with SSDs capable of thousands of IOPS, you are likely to want to adjust this number. There are many tests you can run to determine IOPS. The values above should be nearly that limit *if you are running a dedicated MySQL server*. If you are running any other services on the same machine, you should apportion as appropriate.

```
innodb_io_capacity = 2500  
innodb_io_capacity_max = 3000
```

RAM utilization

Set the RAM available to MySQL. Whilst the rule of thumb is 70-80%, this really depends on whether or not your instance is dedicated to MySQL, and how much RAM is available. Don't *waste* RAM (i.e. resources) if you have a lot available.

```
innodb_buffer_pool_size = 10G
```

Section 38.5: Secure MySQL encryption

The default encryption aes-128-ecb uses Electronic Codebook (ECB) mode, which is insecure and should never be used. Instead, add the following to your configuration file:

```
block_encryption_mode = aes-256-cbc
```

Chapter 39: Events

Section 39.1: Create an Event

MySQL has its EVENT functionality for avoiding complicated cron interactions when much of what you are scheduling is SQL related, and less file related. See the Manual page [here](#). Think of Events as Stored Procedures that are scheduled to run on recurring intervals.

To save time in debugging Event-related problems, keep in mind that the global event handler must be turned on to process events.

```
SHOW VARIABLES WHERE variable_name='event_scheduler';
```

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
| event_scheduler | OFF   |
+-----+-----+
```

With it OFF, nothing will trigger. So turn it on:

```
SET GLOBAL event_scheduler = ON;
```

Schema for testing

```
create table theMessages
(
  id INT AUTO_INCREMENT PRIMARY KEY,
  userId INT NOT NULL,
  message VARCHAR(255) NOT NULL,
  updateDt DATETIME NOT NULL,
  KEY(updateDt)
);

INSERT theMessages(userId,message,updateDt) VALUES (1,'message 123','2015-08-24 11:10:09');
INSERT theMessages(userId,message,updateDt) VALUES (7,'message 124','2015-08-29');
INSERT theMessages(userId,message,updateDt) VALUES (1,'message 125','2015-09-03 12:00:00');
INSERT theMessages(userId,message,updateDt) VALUES (1,'message 126','2015-09-03 14:00:00');
```

The above inserts are provided to show a starting point. Note that the 2 events created below will clean out rows.

Create 2 events, 1st runs daily, 2nd runs every 10 minutes

Ignore what they are actually doing (playing against one another). The point is on the INTERVAL and scheduling.

```
DROP EVENT IF EXISTS `delete7DayOldMessages`;
DELIMITER $$
CREATE EVENT `delete7DayOldMessages`
  ON SCHEDULE EVERY 1 DAY STARTS '2015-09-01 00:00:00'
  ON COMPLETION PRESERVE
DO BEGIN
  DELETE FROM theMessages
  WHERE datediff(now(),updateDt)>6; -- not terribly exact, yesterday but <24hrs is still 1 day

  -- Other code here
END$$
```

```
DELIMITER ;
```

...

```
DROP EVENT IF EXISTS `Every_10_Minutes_Cleanup`;  
DELIMITER $$  
CREATE EVENT `Every_10_Minutes_Cleanup`  
  ON SCHEDULE EVERY 10 MINUTE STARTS '2015-09-01 00:00:00'  
  ON COMPLETION PRESERVE  
DO BEGIN  
  DELETE FROM theMessages  
  WHERE TIMESTAMPDIFF(HOUR, updatedDt, now())>168; -- messages over 1 week old (168 hours)  
  
  -- Other code here  
END$$  
DELIMITER ;
```

Show event statuses (different approaches)

```
SHOW EVENTS FROM my_db_name; -- List all events by schema name (db name)  
SHOW EVENTS;  
SHOW EVENTS\G; -- <----- I like this one from mysql> prompt
```

```
***** 1. row *****  
Db: my_db_name  
Name: delete7DayOldMessages  
Definer: root@localhost  
Time zone: SYSTEM  
Type: RECURRING  
Execute at: NULL  
Interval value: 1  
Interval field: DAY  
Starts: 2015-09-01 00:00:00  
Ends: NULL  
Status: ENABLED  
Originator: 1  
character_set_client: utf8  
collation_connection: utf8_general_ci  
Database Collation: utf8_general_ci  
***** 2. row *****  
Db: my_db_name  
Name: Every_10_Minutes_Cleanup  
Definer: root@localhost  
Time zone: SYSTEM  
Type: RECURRING  
Execute at: NULL  
Interval value: 10  
Interval field: MINUTE  
Starts: 2015-09-01 00:00:00  
Ends: NULL  
Status: ENABLED  
Originator: 1  
character_set_client: utf8  
collation_connection: utf8_general_ci  
Database Collation: utf8_general_ci  
2 rows in set (0.06 sec)
```

Random stuff to consider

```
DROP EVENT someEventName; -- Deletes the event and its code
```

ON COMPLETION PRESERVE -- When the event is done processing, retain it. Otherwise, it is deleted.

Events are like triggers. They are not called by a user's program. Rather, they are scheduled. As such, they succeed or fail silently.

The link to the Manual Page shows quite a bit of flexibility with interval choices, shown below:

interval:

```
quantity {YEAR | QUARTER | MONTH | DAY | HOUR | MINUTE |  
          WEEK | SECOND | YEAR_MONTH | DAY_HOUR | DAY_MINUTE |  
          DAY_SECOND | HOUR_MINUTE | HOUR_SECOND | MINUTE_SECOND}
```

Events are powerful mechanisms that handle recurring and scheduled tasks for your system. They may contain as many statements, DDL and DML routines, and complicated joins as you may reasonably wish. Please see the MySQL Manual Page entitled [Restrictions on Stored Programs](#).

Chapter 40: ENUM

Section 40.1: Why ENUM?

ENUM provides a way to provide an attribute for a row. Attributes with a small number of non-numeric options work best. Examples:

```
reply ENUM('yes', 'no')
gender ENUM('male', 'female', 'other', 'decline-to-state')
```

The values are strings:

```
INSERT ... VALUES ('yes', 'female')
SELECT ... --> yes female
```

Section 40.2: VARCHAR as an alternative

Let's say we have

```
type ENUM('fish', 'mammal', 'bird')
```

An alternative is

```
type VARCHAR(20) COMMENT "fish, bird, etc"
```

This is quite open-ended in that new types are trivially added.

Comparison, and whether better or worse than ENUM:

- (same) INSERT: simply provide the string
- (worse?) On INSERT a typo will go unnoticed
- (same) SELECT: the actual string is returned
- (worse) A lot more space is consumed

Section 40.3: Adding a new option

```
ALTER TABLE tbl MODIFY COLUMN type ENUM('fish', 'mammal', 'bird', 'insect');
```

Notes

- As with all cases of MODIFY COLUMN, you must include **NOT NULL**, and any other qualifiers that originally existed, else they will be lost.
- If you add to the *end* of the list *and* the list is under 256 items, the **ALTER** is done by merely changing the schema. That is there will not be a lengthy table copy. (Old versions of MySQL did not have this optimization.)

Section 40.4: NULL vs NOT NULL

Examples of what happens when NULL and 'bad-value' are stored into nullable and not nullable columns. Also shows usage of casting to numeric via +0.

```
CREATE TABLE enum (
  e      ENUM('yes', 'no')    NOT NULL,
  enull  ENUM('x', 'y', 'z')  NULL
```

```
);
INSERT INTO enum (e, enull)
VALUES
('yes', 'x'),
('no', 'y'),
(NULL, NULL),
('bad-value', 'bad-value');
```

Query OK, 4 rows affected, 3 warnings (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 3

```
mysql>SHOW WARNINGS;
```

```
+-----+-----+-----+
| Level | Code | Message                                     |
+-----+-----+-----+
| Warning | 1048 | Column 'e' cannot be null                 |
| Warning | 1265 | Data truncated for column 'e' at row 4    |
| Warning | 1265 | Data truncated for column 'enull' at row 4 |
+-----+-----+-----+
3 rows in set (0.00 sec)
```

What is in the table after those inserts. This uses "+0" to cast to numeric see what is stored.

```
mysql>SELECT e, e+0 FROM enum;
```

```
+-----+-----+
| e | e+0 |
+-----+-----+
| yes | 1 |
| no | 2 |
|  | 0 | -- NULL
|  | 0 | -- 'bad-value'
+-----+-----+
4 rows in set (0.00 sec)
```

```
mysql>SELECT enull, enull+0 FROM enum;
```

```
+-----+-----+
| enull | enull+0 |
+-----+-----+
| x | 1 |
| y | 2 |
| NULL | NULL |
|  | 0 | -- 'bad-value'
+-----+-----+
4 rows in set (0.00 sec)
```

Chapter 41: Install Mysql container with Docker-Compose

Section 41.1: Simple example with docker-compose

This is an simple example to create a mysql server with docker

1.- create **docker-compose.yml**:

Note: If you want to use same container for all your projects, you should create a PATH in your HOME_PATH. If you want to create it for every project you could create a **docker** directory in your project.

```
version: '2'
services:
  cabin_db:
    image: mysql:latest
    volumes:
      - ".mysql-data/db:/var/lib/mysql"
    restart: always
    ports:
      - 3306:3306
    environment:
      MYSQL_ROOT_PASSWORD: rootpw
      MYSQL_DATABASE: cabin
      MYSQL_USER: cabin
      MYSQL_PASSWORD: cabinpw
```

2.- run it:

```
cd PATH_TO_DOCKER-COMPOSE.YML
docker-compose up -d
```

3.- connect to server

```
mysql -h 127.0.0.1 -u root -P 3306 -p rootpw
```

Hurray!!

4.- stop server

```
docker-compose stop
```

Chapter 42: Character Sets and Collations

Section 42.1: Which CHARACTER SET and COLLATION?

There are dozens of character sets with hundreds of collations. (A given collation belongs to only one character set.) See the output of `SHOW COLLATION;`.

There are usually only 4 CHARACTER SETs that matter:

```
ascii -- basic 7-bit codes.
latin1 -- ascii, plus most characters needed for Western European languages.
utf8 -- the 1-, 2-, and 3-byte subset of utf8. This excludes Emoji and some of Chinese.
utf8mb4 -- the full set of UTF8 characters, covering all current languages.
```

All include English characters, encoded identically. utf8 is a subset of utf8mb4.

Best practice...

- Use utf8mb4 for any **TEXT** or **VARCHAR** column that can have a variety of languages in it.
- Use ascii (latin1 is ok) for hex strings (UUID, MD5, etc) and simple codes (country_code, postal_code, etc).

utf8mb4 did not exist until version 5.5.3, so utf8 was the best available before that.

Outside of MySQL, "UTF8" means the same things as MySQL's utf8mb4, not MySQL's utf8.

Collations start with the charset name and usually end with `_ci` for "case and accent insensitive" or `_bin` for "simply compare the bits".

The 'latest' utf8mb4 collation is `utf8mb4_unicode_520_ci`, based on Unicode 5.20. If you are working with a single language, you might want, say, `utf8mb4_polish_ci`, which will rearrange the letters slightly, based on Polish conventions.

Section 42.2: Setting character sets on tables and fields

You can set a [character set](#) both per table, as well as per individual field using the CHARACTER **SET** and **CHARSET** statements:

```
CREATE TABLE Address (
  `AddressID`    INTEGER NOT NULL PRIMARY KEY,
  `Street`       VARCHAR(80) CHARACTER SET ASCII,
  `City`         VARCHAR(80),
  `Country`      VARCHAR(80) DEFAULT "United States",
  `Active`       BOOLEAN DEFAULT 1,
) Engine=InnoDB default charset=UTF8;
```

City and Country will use UTF8, as we set that as the default character set for the table. Street on the other hand will use `ASCII`, as we've specifically told it to do so.

Setting the right character set is highly dependent on your dataset, but can also highly improve portability between systems working with your data.

Section 42.3: Declaration

```
CREATE TABLE foo ( ...
  name CHARACTER SET utf8mb4
```

```
... );
```

Section 42.4: Connection

Vital to using character sets is to tell the MySQL-server what encoding the client's bytes are. Here is one way:

```
SET NAMES utf8mb4;
```

Each language (PHP, Python, Java, ...) has its own way the it usually preferable to **SET NAMES**.

For example: **SET NAMES utf8mb4**, together with a column declared **CHARACTER SET latin1** -- this will convert from latin1 to utf8mb4 when **INSERTing** and convert back when **SELECTing**.

Chapter 43: MyISAM Engine

Section 43.1: ENGINE=MyISAM

```
CREATE TABLE foo (  
    ...  
) ENGINE=MyISAM;
```

Chapter 4 4: Converting from MyISAM to InnoDB

Section 4 4.1: Basic conversion

```
ALTER TABLE foo ENGINE=InnoDB;
```

This converts the table, but does not take care of any differences between the engines. Most differences will not matter, especially for small tables. But for busier tables, other considerations should be considered. [Conversion considerations](#)

Section 4 4.2: Converting All Tables in one Database

To easily convert all tables in one database, use the following:

```
SET @DB_NAME = DATABASE();

SELECT CONCAT('ALTER TABLE `', table_name, '` ENGINE=InnoDB;') AS sql_statements
FROM information_schema.tables
WHERE table_schema = @DB_NAME
AND `ENGINE` = 'MyISAM'
AND `TABLE_TYPE` = 'BASE TABLE';
```

NOTE: You should be connected to your database for `DATABASE()` function to work, otherwise it will return `NULL`. This mostly applies to standard mysql client shipped with server as it allows to connect without specifying a database.

Run this SQL statement to retrieve all the MyISAM tables in your database.

Finally, copy the output and execute SQL queries from it.

Chapter 45: Transaction

Section 45.1: Start Transaction

A transaction is a sequential group of SQL statements such as select, insert, update or delete, which is performed as one single work unit.

In other words, a transaction will never be complete unless each individual operation within the group is successful. If any operation within the transaction fails, the entire transaction will fail.

Bank transaction will be best example for explaining this. Consider a transfer between two accounts. To achieve this you have to write SQL statements that do the following

1. Check the availability of requested amount in the first account
2. Deduct requested amount from first account
3. Deposit it in second account

If anyone these process fails, the whole should be reverted to their previous state.

ACID : Properties of Transactions

Transactions have the following four standard properties

- **Atomicity:** ensures that all operations within the work unit are completed successfully; otherwise, the transaction is aborted at the point of failure, and previous operations are rolled back to their former state.
- **Consistency:** ensures that the database properly changes states upon a successfully committed transaction.
- **Isolation:** enables transactions to operate independently of and transparent to each other.
- **Durability:** ensures that the result or effect of a committed transaction persists in case of a system failure.

Transactions begin with the statement **START TRANSACTION** or **BEGIN WORK** and end with either a **COMMIT** or a **ROLLBACK** statement. The SQL commands between the beginning and ending statements form the bulk of the transaction.

```
START TRANSACTION;  
SET @transAmt = '500';  
SELECT @availableAmt:=ledgerAmt FROM accTable WHERE customerId=1 FOR UPDATE;  
UPDATE accTable SET ledgerAmt=ledgerAmt-@transAmt WHERE customerId=1;  
UPDATE accTable SET ledgerAmt=ledgerAmt+@transAmt WHERE customerId=2;  
COMMIT;
```

With **START TRANSACTION**, autocommit remains disabled until you end the transaction with **COMMIT** or **ROLLBACK**. The autocommit mode then reverts to its previous state.

The **FOR UPDATE** indicates (and locks) the row(s) for the duration of the transaction.

While the transaction remains uncommitted, this transaction will not be available for others users.

General Procedures involved in Transaction

- Begin transaction by issuing SQL command **BEGIN WORK** or **START TRANSACTION**.
- Run all your SQL statements.
- Check whether everything is executed according to your requirement.
- If yes, then issue **COMMIT** command, otherwise issue a **ROLLBACK** command to revert everything to the previous state.

- Check for errors even after **COMMIT** if you are using, or might eventually use, Galera/PXC.

Section 45.2: COMMIT , ROLLBACK and AUTOCOMMIT

AUTOCOMMIT

MySQL automatically commits statements that are not part of a transaction. The results of any **UPDATE,DELETE** or **INSERT** statement not preceded with a **BEGIN** or **START TRANSACTION** will immediately be visible to all connections.

The AUTOCOMMIT variable is set *true* by default. This can be changed in the following way,

```

--->To make autocommit false
SET AUTOCOMMIT=false;
--or
SET AUTOCOMMIT=0;

--->To make autocommit true
SET AUTOCOMMIT=true;
--or
SET AUTOCOMMIT=1;

```

To view AUTOCOMMIT status

```
SELECT @@autocommit;
```

COMMIT

If AUTOCOMMIT set to false and the transaction not committed, the changes will be visible only for the current connection.

After **COMMIT** statement commits the changes to the table, the result will be visible for all connections.

We consider two connections to explain this

Connection 1

```

--->Before making autocommit false one row added in a new table
mysql> INSERT INTO testTable VALUES (1);

--->Making autocommit = false
mysql> SET autocommit=0;

mysql> INSERT INTO testTable VALUES (2), (3);
mysql> SELECT * FROM testTable;
+-----+
| tId |
+-----+
| 1 |
| 2 |
| 3 |
+-----+

```

Connection 2

```

mysql> SELECT * FROM testTable;
+-----+
| tId |

```

```
+-----+
| 1 |
+-----+
---> Row inserted before autocommit=false only visible here
```

Connection 1

```
mysql> COMMIT;
--->Now COMMIT is executed in connection 1
mysql> SELECT * FROM testTable;
+-----+
| tId |
+-----+
| 1 |
| 2 |
| 3 |
+-----+
```

Connection 2

```
mysql> SELECT * FROM testTable;
+-----+
| tId |
+-----+
| 1 |
| 2 |
| 3 |
+-----+
--->Now all the three rows are visible here
```

ROLLBACK

If anything went wrong in your query execution, **ROLLBACK** is used to revert the changes. See the explanation below

```
--->Before making autocommit false one row added in a new table
mysql> INSERT INTO testTable VALUES (1);

--->Making autocommit = false
mysql> SET autocommit=0;

mysql> INSERT INTO testTable VALUES (2), (3);
mysql> SELECT * FROM testTable;
+-----+
| tId |
+-----+
| 1 |
| 2 |
| 3 |
+-----+
```

Now we are executing **ROLLBACK**

```
--->Rollback executed now
mysql> ROLLBACK;

mysql> SELECT * FROM testTable;
+-----+
| tId |
+-----+
```

```
| 1 |
+----+
--->Rollback removed all rows which all are not committed
```

Once **COMMIT** is executed, then **ROLLBACK** will not cause anything

```
mysql> INSERT INTO testTable VALUES (2), (3);
mysql> SELECT * FROM testTable;
mysql> COMMIT;
```

```
+----+
| tId |
+----+
| 1 |
| 2 |
| 3 |
+----+
```

```
--->Rollback executed now
```

```
mysql> ROLLBACK;
```

```
mysql> SELECT * FROM testTable;
```

```
+----+
| tId |
+----+
| 1 |
| 2 |
| 3 |
+----+
```

```
--->Rollback not removed any rows
```

If **AUTOCOMMIT** is set *true*, then **COMMIT** and **ROLLBACK** is useless

Section 45.3: Transaction using JDBC Driver

Transaction using JDBC driver is used to control how and when a transaction should commit and rollback. Connection to MySQL server is created using JDBC driver

[JDBC driver for MySQL](#) can be downloaded here

Lets start with getting a connection to database using JDBC driver

```
Class.forName("com.mysql.jdbc.Driver");
Connection con = DriverManager.getConnection(DB_CONNECTION_URL,DB_USER,USER_PASSWORD);
--->Example for connection url "jdbc:mysql://localhost:3306/testDB";
```

Character Sets : This indicates what character set the client will use to send SQL statements to the server. It also specifies the character set that the server should use for sending results back to the client.

This should be mentioned while creating connection to server. So the connection string should be like,

```
jdbc:mysql://localhost:3306/testDB?useUnicode=true&characterEncoding=utf8
```

See this for more details about Character Sets and Collations

When you open connection, the **AUTOCOMMIT** mode is set to *true* by default, that should be changed *false* to start transaction.

```
con.setAutoCommit(false);
```

You should always call `setAutoCommit()` method right after you open a connection.

Otherwise use **START TRANSACTION** or **BEGIN WORK** to start a new transaction. By using **START TRANSACTION** or **BEGIN WORK**, no need to change `AUTO COMMIT false`. That will be automatically disabled.

Now you can start transaction. See a complete JDBC transaction example below.

```
package jdbcTest;

import java.sql.Connection;
import java.sql.PreparedStatement;
import java.sql.SQLException;

public class accTrans {

    public static void doTransfer(double transAmount, int customerIdFrom, int customerIdTo) {

        Connection con = null;
        PreparedStatement pstmt = null;
        ResultSet rs = null;

        try {
            String DB_CONNECTION_URL =
"jdbc:mysql://localhost:3306/testDB?useUnicode=true&characterEncoding=utf8";

            Class.forName("com.mysql.jdbc.Driver");
            con = DriverManager.getConnection(DB_CONNECTION_URL, DB_USER, USER_PASSWORD);

            --->set auto commit to false
            con.setAutoCommit(false);
            ---> or use con.START TRANSACTION / con.BEGIN WORK

            --->Start SQL Statements for transaction
            --->Checking availability of amount
            double availableAmt = 0;
            pstmt = con.prepareStatement("SELECT ledgerAmt FROM accTable WHERE customerId=? FOR
UPDATE");
            pstmt.setInt(1, customerIdFrom);
            rs = pstmt.executeQuery();
            if(rs.next())
                availableAmt = rs.getDouble(1);

            if(availableAmt >= transAmount)
            {
                ---> Do Transfer
                ---> taking amount from cutomerIdFrom
                pstmt = con.prepareStatement("UPDATE accTable SET ledgerAmt=ledgerAmt-? WHERE
customerId=?");
                pstmt.setDouble(1, transAmount);
                pstmt.setInt(2, customerIdFrom);
                pstmt.executeUpdate();

                ---> depositing amount in cutomerIdTo
                pstmt = con.prepareStatement("UPDATE accTable SET ledgerAmt=ledgerAmt+? WHERE
customerId=?");
                pstmt.setDouble(1, transAmount);
                pstmt.setInt(2, customerIdTo);
                pstmt.executeUpdate();
            }
        }
    }
}
```

```

        con.commit();
    }
    --->If you performed any insert,update or delete operations before
    ---> this availability check, then include this else part
    /*else { --->Rollback the transaction if availability is less than required
        con.rollback();
    }*/

} catch (SQLException ex) {
    ---> Rollback the transaction in case of any error
    con.rollback();
} finally {
    try {
        if(rs != null) rs.close();
        if(pstmt != null) pstmt.close();
        if(con != null) con.close();
    }
}

}

public static void main(String[] args) {
    doTransfer(500, 1020, 1021);
    --->doTransfer(transAmount, customerIdFrom, customerIdTo);
}
}

```

JDBC transaction make sure of all SQL statements within a transaction block are executed successful, if either one of the SQL statement within transaction block is failed, abort and rollback everything within the transaction block.

Chapter 46: Log files

Section 46.1: Slow Query Log

The Slow Query Log consists of log events for queries taking up to `long_query_time` seconds to finish. For instance, up to 10 seconds to complete. To see the time threshold currently set, issue the following:

```
SELECT @@long_query_time;
+-----+
| @@long_query_time |
+-----+
|          10.000000 |
+-----+
```

It can be set as a GLOBAL variable, in `my.cnf` or `my.ini` file. Or it can be set by the connection, though this is unusual. The value can be set between 0 to 10 (seconds). What value to use?

- 10 is so high as to be almost useless;
- 2 is a compromise;
- 0.5 and other fractions are possible;
- 0 captures everything; this could fill up disk dangerously fast, but can be very useful.

The capturing of slow queries is either turned on or off. And the file logged to is also specified. The below captures these concepts:

```
SELECT @@slow_query_log; -- Is capture currently active? (1=On, 0=Off)
SELECT @@slow_query_log_file; -- filename for capture. Resides in datadir
SELECT @@datadir; -- to see current value of the location for capture file

SET GLOBAL slow_query_log=0; -- Turn Off
-- make a backup of the Slow Query Log capture file. Then delete it.
SET GLOBAL slow_query_log=1; -- Turn it back On (new empty file is created)
```

For more information, please see the MySQL Manual Page [The Slow Query Log](#)

Note: The above information on turning on/off the slowlog was changed in 5.6(?); older version had another mechanism.

The "best" way to see what is slowing down your system:

```
long_query_time=...
turn on the slowlog
run for a few hours
turn off the slowlog (or raise the cutoff)
run pt-query-digest to find the 'worst' couple of queries. Or mysqldumpslow -s t
```

Section 46.2: A List

- General log - all queries - see VARIABLE `general_log`
- Slow log - queries slower than `long_query_time` - `slow_query_log_file`
- Binlog - for replication and backup - `log_bin_basename`
- Relay log - also for replication
- general errors - `mysqld.err`

- start/stop - mysql.log (not very interesting) - log_error
- InnoDB redo log - iblog*

See the variables `basedir` and `datadir` for default location for many logs

Some logs are turned on/off by other VARIABLES. Some are either written to a file or to a table.

(Note to reviewers: This needs more details and more explanation.)

Documenters: please include the default location and name for each log type, for both Windows and *nix. (Or at least as much as you can.)

Section 46.3: General Query Log

The General Query Log contains a listing of general information from client connects, disconnects, and queries. It is invaluable for debugging, yet it poses as a hindrance to performance (citation?).

An example view of a General Query Log is seen below:

```
36 Query insert [questions]_c23(qId,ownerId,title,votes,answers,isClosed,closeVotes,views,ownerRep,
  comments,answeredAccepted,askDate,closeDate,lastScanDate,ign,bn,pvtc,
  mainTagForImport,prepStatus,touches,status,status_bef_change,cv_bef_change,max_cv_reached)
  values(38666373, 1322183, 'How to post a numeric value in c#', 0, 1, 0, 0, 50, 1,
  0, 0, '2016-07-29 19:40:32', null, now(), 0, 0, 0,
  'c%23',0,1,'0',' ',0,0)
  on duplicate key update title='How to post a numeric value in c#', votes=0, answers=1, views=50,ownerRep=1,
  answeredAccepted=0,lastScanDate=now(), touches=touches+1,status='0'
```

To determine if the General Log is currently being captured:

```
SELECT @@general_log; -- 1 = Capture is active; 0 = It is not.
```

To determine the filename of the capture file:

```
SELECT @@general_log_file; -- Full path to capture file
```

If the fullpath to the file is not shown, the file exists in the `datadir`.

Windows example:

```
+-----+
| @@general_log_file |
+-----+
| C:\ProgramData\MySQL\MySQL Server 5.7\Data\GuySmiley.log |
+-----+
```

Linux:

```
+-----+
| @@general_log_file |
+-----+
| /var/lib/mysql/ip-ww-xx-yy-zz.log |
+-----+
```

When changes are made to the `general_log_file` GLOBAL variable, the new log is saved in the `datadir`. However, the fullpath may no longer be reflected by examining the variable.

In the case of no entry for `general_log_file` in the configuration file, it will default to `@@hostname.log` in the `datadir`.

Best practices are to turn OFF capture. Save the log file to a backup directory with a filename reflecting the begin/end datetime of the capture. Deleting the prior file if a filesystem *move* did not occur of that file. Establish a new filename for the log file and turn capture ON (all show below). Best practices also include a careful determination if you even want to capture at the moment. Typically, capture is ON for debugging purposes only.

A typical filesystem filename for a backed-up log might be:

```
/LogBackup/GeneralLog_20160802_1520_to_20160802_1815.log
```

where the date and time are part to the filename as a range.

For Windows note the following sequence with setting changes.

```
SELECT @@general_log; -- 0. Not being captured
SELECT @@general_log_file; -- C:\ProgramData\MySQL\MySQL Server 5.6\Data\GuySmiley.log
SELECT @@datadir; -- C:\ProgramData\MySQL\MySQL Server 5.7\Data\
SET GLOBAL general_log_file='GeneralLogBegin_20160803_1420.log'; -- datetime clue
SET GLOBAL general_log=1; -- Turns on actual log capture. File is created under `datadir`
SET GLOBAL general_log=0; -- Turn logging off
```

Linux is similar. These would represent dynamic changes. Any restart of the server would pick up configuration file settings.

As for the configuration file, consider the following relevant variable settings:

```
[mysqld]
general_log_file = /path/to/currentquery.log
general_log      = 1
```

In addition, the variable `log_output` can be configured for **TABLE** output, not just FILE. For that, please see [Destinations](#).

Please see the MySQL Manual Page [The General Query Log](#).

Section 46.4: Error Log

The Error Log is populated with start and stop information, and critical events encountered by the server.

The following is an example of its contents:

```
2016-08-02 20:40:39 2420 [Note] Shutting down plugin 'binlog'
2016-08-02 20:40:39 2420 [Note] mysqld: Shutdown complete

2016-08-02 20:43:11 2888 [Note] Plugin 'FEDERATED' is disabled.
2016-08-02 20:43:11 2888 [Note] InnoDB: Using atomics to ref count buffer pool pages
2016-08-02 20:43:11 2888 [Note] InnoDB: The InnoDB memory heap is disabled
```

The variable `log_error` holds the path to the log file for error logging.

In the absence of a configuration file entry for `log_error`, the system will default its values to `@@hostname.err` in the `datadir`. Note that `log_error` is not a dynamic variable. As such, changes are done through a `cnf` or `ini` file changes and a server restart (or by seeing "Flushing and Renaming the Error Log File" in the Manual Page link at the bottom here).

Logging cannot be disabled for errors. They are important for system health while troubleshooting problems. Also, entries are infrequent compared to the General Query Log.

The GLOBAL variable `log_warnings` sets the level for verbosity which varies by server version. The following snippet illustrates:

```
SELECT @@log_warnings; -- make a note of your prior setting
SET GLOBAL log_warnings=2; -- setting above 1 increases output (see server version)
```

`log_warnings` as seen above is a dynamic variable.

Configuration file changes in `cnf` and `ini` files might look like the following.

```
[mysqld]
log_error      = /path/to/CurrentError.log
log_warnings   = 2
```

MySQL 5.7.2 expanded the warning level verbosity to 3 and added the GLOBAL `log_error_verbosity`. Again, it was [introduced](#) in 5.7.2. It can be set dynamically and checked as a variable or set via `cnf` or `ini` configuration file settings.

As of MySQL 5.7.2:

```
[mysqld]
log_error      = /path/to/CurrentError.log
log_warnings   = 2
log_error_verbosity = 3
```

Please see the MySQL Manual Page entitled [The Error Log](#) especially for Flushing and Renaming the Error Log file, and its *Error Log Verbosity* section with versions related to `log_warnings` and `error_log_verbosity`.

Chapter 47: Clustering

Section 47.1: Disambiguation

"MySQL Cluster" disambiguation...

- NDB Cluster -- A specialized, mostly in-memory, engine. Not widely used.
- Galera Cluster aka Percona XtraDB Cluster aka PXC aka MariaDB with Galera. -- A very good High Availability solution for MySQL; it goes beyond Replication.

See individual pages on those variants of "Cluster".

For "clustered index" see page(s) on **PRIMARY KEY**.

Chapter 48: Partitioning

Section 48.1: RANGE Partitioning

A table that is partitioned by range is partitioned in such a way that each partition contains rows for which the partitioning expression value lies within a given range. Ranges should be contiguous but not overlapping, and are defined using the **VALUES LESS THAN** operator. For the next few examples, suppose that you are creating a table such as the following to hold personnel records for a chain of 20 video stores, numbered 1 through 20:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),  
    hired DATE NOT NULL DEFAULT '1970-01-01',  
    separated DATE NOT NULL DEFAULT '9999-12-31',  
    job_code INT NOT NULL,  
    store_id INT NOT NULL  
);
```

This table can be partitioned by range in a number of ways, depending on your needs. One way would be to use the `store_id` column. For instance, you might decide to partition the table 4 ways by adding a **PARTITION BY RANGE** clause as shown here:

```
ALTER TABLE employees PARTITION BY RANGE (store_id) (  
    PARTITION p0 VALUES LESS THAN (6),  
    PARTITION p1 VALUES LESS THAN (11),  
    PARTITION p2 VALUES LESS THAN (16),  
    PARTITION p3 VALUES LESS THAN MAXVALUE  
);
```

MAXVALUE represents an integer value that is always greater than the largest possible integer value (in mathematical language, it serves as a least upper bound).

based on [MySQL official document](#).

Section 48.2: LIST Partitioning

List partitioning is similar to range partitioning in many ways. As in partitioning by RANGE, each partition must be explicitly defined. The chief difference between the two types of partitioning is that, in list partitioning, each partition is defined and selected based on the membership of a column value in one of a set of value lists, rather than in one of a set of contiguous ranges of values. This is done by using **PARTITION BY LIST(expr)** where `expr` is a column value or an expression based on a column value and returning an integer value, and then defining each partition by means of a **VALUES IN (value_list)**, where `value_list` is a comma-separated list of integers.

For the examples that follow, we assume that the basic definition of the table to be partitioned is provided by the **CREATE TABLE** statement shown here:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),  
    hired DATE NOT NULL DEFAULT '1970-01-01',  
    separated DATE NOT NULL DEFAULT '9999-12-31',
```

```
    job_code INT,  
    store_id INT  
);
```

Suppose that there are 20 video stores distributed among 4 franchises as shown in the following table.

Region Store ID Numbers

North 3, 5, 6, 9, 17

East 1, 2, 10, 11, 19, 20

West 4, 12, 13, 14, 18

Central 7, 8, 15, 16

To partition this table in such a way that rows for stores belonging to the same region are stored in the same partition

```
ALTER TABLE employees PARTITION BY LIST(store_id) (  
    PARTITION pNorth VALUES IN (3,5,6,9,17),  
    PARTITION pEast VALUES IN (1,2,10,11,19,20),  
    PARTITION pWest VALUES IN (4,12,13,14,18),  
    PARTITION pCentral VALUES IN (7,8,15,16)  
);
```

based on [MySQL official document](#).

Section 48.3: HASH Partitioning

Partitioning by HASH is used primarily to ensure an even distribution of data among a predetermined number of partitions. With range or list partitioning, you must specify explicitly into which partition a given column value or set of column values is to be stored; with hash partitioning, MySQL takes care of this for you, and you need only specify a column value or expression based on a column value to be hashed and the number of partitions into which the partitioned table is to be divided.

The following statement creates a table that uses hashing on the store_id column and is divided into 4 partitions:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),  
    hired DATE NOT NULL DEFAULT '1970-01-01',  
    separated DATE NOT NULL DEFAULT '9999-12-31',  
    job_code INT,  
    store_id INT  
)  
PARTITION BY HASH(store_id)  
PARTITIONS 4;
```

If you do not include a PARTITIONS clause, the number of partitions defaults to 1.

based on [MySQL official document](#).

Chapter 49: Replication

Section 49.1: Master - Slave Replication Setup

Consider 2 MySQL Servers for replication setup, one is a Master and the other is a Slave.

We are going to configure the Master that it should keep a log of every action performed on it. We are going to configure the Slave server that it should look at the log on the Master and whenever changes happens in log on the Master, it should do the same thing.

Master Configuration

First of all, we need to create a user on the Master. This user is going to be used by Slave to create a connection with the Master.

```
CREATE USER 'user_name'@'%' IDENTIFIED BY 'user_password';  
GRANT REPLICATION SLAVE ON *.* TO 'user_name'@'%;  
FLUSH PRIVILEGES;
```

Change user_name and user_password according to your Username and Password.

Now my.cnf (my.cnf in Linux) file should be edited. Include the following lines in [mysqld] section.

```
server-id = 1  
log-bin = mysql-bin.log  
binlog-do-db = your_database
```

The first line is used to assign an ID to this MySQL server.

The second line tells MySQL to start writing a log in the specified log file. In Linux this can be configured like log-bin = /home/mysql/logs/mysql-bin.log. If you are starting replication in a MySQL server in which replication has already been used, make sure this directory is empty of all replication logs.

The third line is used to configure the database for which we are going to write log. You should replace your_database with your database name.

Make sure skip-networking has not been enabled and restart the MySQL server(Master)

Slave Configuration

my.cnf file should be edited in Slave also. Include the following lines in [mysqld] section.

```
server-id = 2  
master-host = master_ip_address  
master-connect-retry = 60  
  
master-user = user_name  
master-password = user_password  
replicate-do-db = your_database  
  
relay-log = slave-relay.log  
relay-log-index = slave-relay-log.index
```

The first line is used to assign an ID to this MySQL server. This ID should be unique.

The second line is the I.P address of the Master server. Change this according to your Master system I.P.

The third line is used to set a retry limit in seconds.

The next two lines tell the username and password to the Slave, by using which it connect the Master.

Next line set the database it needs to replicate.

The last two lines used to assign `relay-log` and `relay-log-index` file names.

Make sure `skip-networking` has not been enabled and restart the MySQL server(Slave)

Copy Data to Slave

If data is constantly being added to the Master, we will have to prevent all database access on the Master so nothing can be added. This can be achieved by run the following statement in Master.

```
FLUSH TABLES WITH READ LOCK;
```

If no data is being added to the server, you can skip the above step.

We are going to take data backup of the Master by using `mysqldump`

```
mysqldump your_database -u root -p > D://Backup/backup.sql;
```

Change `your_database` and backup directory according to your setup. You will now have a file called `backup.sql` in the given location.

If your database not exists in your Slave, create that by executing the following

```
CREATE DATABASE `your_database`;
```

Now we have to import backup into Slave MySQL server.

```
mysql -u root -p your_database <D://Backup/backup.sql  
---->Change `your_database` and backup directory according to your setup
```

Start Replication

To start replication, we need to find the log file name and log position in the Master. So, run the following in Master

```
SHOW MASTER STATUS;
```

This will give you an output like below

File	Position	Binlog_Do_DB	Binlog_Ignore_DB
mysql-bin.000001	130	your_database	

Then run the following in Slave

```
SLAVE STOP;  
CHANGE MASTER TO MASTER_HOST='master_ip_address', MASTER_USER='user_name',
```

```
MASTER_PASSWORD='user_password', MASTER_LOG_FILE='mysql-bin.000001', MASTER_LOG_POS=130;  
SLAVE START;
```

First we stop the Slave. Then we tell it exactly where to look in the Master log file. For MASTER_LOG_FILE name and MASTER_LOG_POS, use the values which we got by running **SHOW MASTER STATUS** command on the Master.

You should change the I.P of the Master in MASTER_HOST, and change the user and password accordingly.

The Slave will now be waiting. The status of the Slave can be viewed by run the following

```
SHOW SLAVE STATUS;
```

If you previously executed **FLUSH TABLES WITH READ LOCK** in Master, release the tables from lock by run the following

```
UNLOCK TABLES;
```

Now the Master keep a log for every action performed on it and the Slave server look at the log on the Master. Whenever changes happens in log on the Master, Slave replicate that.

Section 49.2: Replication Errors

Whenever there is an error while running a query on the slave, MySQL stop replication automatically to identify the problem and fix it. This mainly because an event caused a duplicate key or a row was not found and it cannot be updated or deleted. You can skip such errors, even if this is not recommended

To skip just one query that is hanging the slave, use the following syntax

```
SET GLOBAL sql_slave_skip_counter = N;
```

This statement skips the next N events from the master. This statement is valid only when the slave threads are not running. Otherwise, it produces an error.

```
STOP SLAVE;  
SET GLOBAL sql_slave_skip_counter=1;  
START SLAVE;
```

In some cases this is fine. But if the statement is part of a multi-statement transaction, it becomes more complex, because skipping the error producing statement will cause the whole transaction to be skipped.

If you want to skip more queries which producing same error code and if you are sure that skipping those errors will not bring your slave inconsistent and you want to skip them all, you would add a line to skip that error code in your my.cnf.

For example you might want to skip all duplicate errors you might be getting

```
1062 | Error 'Duplicate entry 'xyz' for key 1' on query
```

Then add the following to your my.cnf

```
slave-skip-errors = 1062
```

You can skip also other type of errors or all error codes, but make sure that skipping those errors will not bring your slave inconsistent. The following are the syntax and examples

```
slave-skip-errors=[err_code1,err_code2,...|all]
```

```
slave-skip-errors=1062,1053
```

```
slave-skip-errors=all
```

```
slave-skip-errors=ddl_exist_errors
```

Chapter 50: Backup using mysqldump

Option	Effect
--	# Server login options
-h (--host)	Host (IP address or hostname) to connect to. Default is localhost (127.0.0.1) Example: -h localhost
-u (--user)	MySQL user
-p (--password)	MySQL password. Important: When using -p, there must not be a space between the option and the password. Example: -pMyPassword
--	# Dump options
--add-drop-database	Add a DROP DATABASE statement before each CREATE DATABASE statement. Useful if you want to replace databases in the server.
--add-drop-table	Add a DROP TABLE statement before each CREATE TABLE statement. Useful if you want to replace tables in the server.
--no-create-db	Suppress the CREATE DATABASE statements in the dump. This is useful when you're sure the database(s) you're dumping already exist(s) in the server where you'll load the dump.
-t (--no-create-info)	Suppress all CREATE TABLE statements in the dump. This is useful when you want to dump only the data from the tables and will use the dump file to populate identical tables in another database / server.
-d (--no-data)	Do not write table information. This will only dump the CREATE TABLE statements. Useful for creating "template" databases
-R (--routines)	Include stored procedures / functions in the dump.
-K (--disable-keys)	Disable keys for each table before inserting the data, and enable keys after the data is inserted. This speeds up inserts only in MyISAM tables with non-unique indexes.

Section 50.1: Specifying username and password

```
> mysqldump -u username -p [other options]
Enter password:
```

If you need to specify the password on the command line (e.g. in a script), you can add it after the -p option *without* a space:

```
> mysqldump -u username -ppassword [other options]
```

If your password contains spaces or special characters, remember to use escaping depending on your shell / system.

Optionally the extended form is:

```
> mysqldump --user=username --password=password [other options]
```

(Explicitly specifying the password on the commandline is Not Recommended due to security concerns.)

Section 50.2: Creating a backup of a database or table

Create a snapshot of a whole database:

```
mysqldump [options] db_name > filename.sql
```

Create a snapshot of multiple databases:

```
mysqldump [options] --databases db_name1 db_name2 ... > filename.sql
mysqldump [options] --all-databases > filename.sql
```

Create a snapshot of one or more tables:

```
mysqldump [options] db_name table_name... > filename.sql
```

Create a snapshot *excluding* one or more tables:

```
mysqldump [options] db_name --ignore-table=tbl1 --ignore-table=tbl2 ... > filename.sql
```

The file extension `.sql` is fully a matter of style. Any extension would work.

Section 50.3: Restoring a backup of a database or table

```
mysql [options] db_name < filename.sql
```

Note that:

- `db_name` needs to be an existing database;
- your authenticated user has sufficient privileges to execute all the commands inside your `filename.sql`;
- The file extension `.sql` is fully a matter of style. Any extension would work.
- You cannot specify a table name to load into even though you could specify one to dump from. This must be done within `filename.sql`.

Alternatively, when in the **MySQL Command line tool**, you can restore (or run any other script) by using the source command:

```
source filename.sql
```

or

```
\. filename.sql
```

Section 50.4: Transferring data from one MySQL server to another

If you need to copy a database from one server to another, you have two options:

Option 1:

1. Store the dump file in the source server
2. Copy the dump file to your destination server
3. Load the dump file into your destination server

On the source server:

```
mysqldump [options] > dump.sql
```

On the destination server, copy the dump file and execute:

```
mysql [options] < dump.sql
```

Option 2:

If the destination server can connect to the host server, you can use a pipeline to copy the database from one

server to the other:

On the destination server

```
mysqldump [options to connect to the source server] | mysql [options]
```

Similarly, the script could be run on the source server, pushing to the destination. In either case, it is likely to be significantly faster than Option 1.

Section 50.5: mysqldump from a remote server with compression

In order to use compression over the wire for a faster transfer, pass the `--compress` option to `mysqldump`. Example:

```
mysqldump -h db.example.com -u username -p --compress dbname > dbname.sql
```

Important: If you don't want to lock up the *source* db, you should also include `--lock-tables=false`. But you may not get an internally consistent db image that way.

To also save the file compressed, you can pipe to `gzip`.

```
mysqldump -h db.example.com -u username -p --compress dbname | gzip --stdout > dbname.sql.gz
```

Section 50.6: restore a gzipped mysqldump file without uncompressing

```
gunzip -c dbname.sql.gz | mysql dbname -u username -p
```

Note: `-c` means write output to stdout.

Section 50.7: Backup database with stored procedures and functions

By default stored procedures and functions or not generated by `mysqldump`, you will need to add the parameter `--routines` (or `-R`):

```
mysqldump -u username -p -R db_name > dump.sql
```

When using `--routines` the creation and change time stamps are not maintained, instead you should dump and reload the contents of `mysql.proc`.

Section 50.8: Backup direct to Amazon S3 with compression

If you wish to make a complete backup of a large MySQL installation and do not have sufficient local storage, you can dump and compress it directly to an Amazon S3 bucket. It's also a good practice to do this without having the DB password as part of the command:

```
mysqldump -u root -p --host=localhost --opt --skip-lock-tables --single-transaction \
  --verbose --hex-lob --routines --triggers --all-databases |
gzip -9 | s3cmd put - s3://s3-bucket/db-server-name.sql.gz
```

You are prompted for the password, after which the backup starts.

Chapter 51: mysqlimport

Parameter	Description
<code>--delete -D</code>	empty the table before importing the text file
<code>--fields-optionally-enclosed-by</code>	define the character that quotes the fields
<code>--fields-terminated-by</code>	field terminator
<code>--ignore -i</code>	ignore the ingested row in case of duplicate-keys
<code>--lines-terminated-by</code>	define row terminator
<code>--password -p</code>	password
<code>--port -P</code>	port
<code>--replace -r</code>	overwrite the old entry row in case of duplicate-keys
<code>--user -u</code>	username
<code>--where -w</code>	specify a condition

Section 51.1: Basic usage

Given the tab-separated file `employee.txt`

```
1 \t Arthur Dent
2 \t Marvin
3 \t Zaphod Beeblebrox
```

```
$ mysql --user=user --password=password mycompany -e 'CREATE TABLE employee(id INT, name VARCHAR(100), PRIMARY KEY (id))'
```

```
$ mysqlimport --user=user --password=password mycompany employee.txt
```

Section 51.2: Using a custom field-delimiter

Given the text file `employee.txt`

```
1|Arthur Dent
2|Marvin
3|Zaphod Beeblebrox
```

```
$ mysqlimport --fields-terminated-by='|' mycompany employee.txt
```

Section 51.3: Using a custom row-delimiter

This example is useful for windows-like endings:

```
$ mysqlimport --lines-terminated-by='\r\n' mycompany employee.txt
```

Section 51.4: Handling duplicate keys

Given the table `Employee`

id	Name
3	Yooden Vranx

And the file `employee.txt`

```
1 \t Arthur Dent
2 \t Marvin
3 \t Zaphod Beeblebrox
```

The `--ignore` option will ignore the entry on duplicate keys

```
$ mysqlimport --ignore mycompany employee.txt
```

id	Name
----	------

1	Arthur Dent
2	Marvin
3	Yooden Vranx

The `--replace` option will overwrite the old entry

```
$ mysqlimport --replace mycompany employee.txt
```

id	Name
----	------

1	Arthur Dent
2	Marvin
3	Zaphod Beeblebrox

Section 51.5: Conditional import

```
$ mysqlimport --where="id>2" mycompany employee.txt
```

Section 51.6: Import a standard csv

```
$ mysqlimport
  --fields-optionally-enclosed-by='"'
  --fields-terminated-by=,
  --lines-terminated-by="\r\n"
mycompany employee.csv
```

Chapter 52: LOAD DATA INFILE

Section 52.1: using LOAD DATA INFILE to load large amount of data to database

Consider the following example assuming that you have a ';' delimited CSV to load into your database.

```
1;max;male;manager;12-7-1985
2;jack;male;executive;21-8-1990
.
.
.
1000000;marta;female;accountant;15-6-1992
```

Create the table for insertion.

```
CREATE TABLE `employee` ( `id` INT NOT NULL ,
                           `name` VARCHAR NOT NULL ,
                           `sex` VARCHAR NOT NULL ,
                           `designation` VARCHAR NOT NULL ,
                           `dob` VARCHAR NOT NULL );
```

Use the following query to insert the values in that table.

```
LOAD DATA INFILE 'path of the file/file_name.txt'
INTO TABLE employee
FIELDS TERMINATED BY ';' //specify the delimiter separating the values
LINES TERMINATED BY '\r\n'
(id,name,sex,designation,dob)
```

Consider the case where the date format is non standard.

```
1;max;male;manager;17-Jan-1985
2;jack;male;executive;01-Feb-1992
.
.
.
1000000;marta;female;accountant;25-Apr-1993
```

In this case you can change the format of the dob column before inserting like this.

```
LOAD DATA INFILE 'path of the file/file_name.txt'
INTO TABLE employee
FIELDS TERMINATED BY ';' //specify the delimiter separating the values
LINES TERMINATED BY '\r\n'
(id,name,sex,designation,@dob)
SET date = STR_TO_DATE(@date, '%d-%b-%Y');
```

This example of LOAD DATA INFILE does not specify all the available features.

You can see more references on LOAD DATA INFILE [here](#).

Section 52.2: Load data with duplicates

If you use the **LOAD DATA INFILE** command to populate a table with existing data, you will often find that the import fails due to duplicates. There are several possible ways to overcome this problem.

LOAD DATA LOCAL

If this option has been enabled in your server, it can be used to load a file that exists on the client computer rather than the server. A side effect is that duplicate rows for unique values are ignored.

```
LOAD DATA LOCAL INFILE 'path of the file/file_name.txt'
INTO TABLE employee
```

LOAD DATA INFILE 'fname' REPLACE

When the replace keyword is used duplicate unique or primary keys will result in the existing row being replaced with new ones

```
LOAD DATA INFILE 'path of the file/file_name.txt'
REPLACE INTO TABLE employee
```

LOAD DATA INFILE 'fname' IGNORE

The opposite of **REPLACE**, existing rows will be preserved and new ones ignored. This behavior is similar to **LOCAL** described above. However the file need not exist on the client computer.

```
LOAD DATA INFILE 'path of the file/file_name.txt'
IGNORE INTO TABLE employee
```

Load via intermediary table

Sometimes ignoring or replacing all duplicates may not be the ideal option. You may need to make decisions based on the contents of other columns. In that case the best option is to load into an intermediary table and transfer from there.

```
INSERT INTO employee SELECT * FROM intermediary WHERE ...
```

Section 52.3: Import a CSV file into a MySQL table

The following command imports CSV files into a MySQL table with the same columns while respecting CSV quoting and escaping rules.

```
load data infile '/tmp/file.csv'
into table my_table
fields terminated by ','
optionally enclosed by '"'
escaped by '\\'
lines terminated by '\n'
ignore 1 lines; -- skip the header row
```

Chapter 53: MySQL Unions

Section 53.1: Union operator

The UNION operator is used to combine the result-set (*only distinct values*) of two or more SELECT statements.

Query: (To select all the different cities (*only distinct values*) from the "Customers" and the "Suppliers" tables)

```
SELECT City FROM Customers
UNION
SELECT City FROM Suppliers
ORDER BY City;
```

Result:

Number of Records: 10

```
City
-----
Aachen
Albuquerque
Anchorage
Annecy
Barcelona
Barquisimeto
Bend
Bergamo
Berlin
Bern
```

Section 53.2: Union ALL

UNION ALL to select all (duplicate values also) cities from the "Customers" and "Suppliers" tables.

Query:

```
SELECT City FROM Customers
UNION ALL
SELECT City FROM Suppliers
ORDER BY City;
```

Result:

Number of Records: 12

```
City
-----
Aachen
Albuquerque
Anchorage
Ann Arbor
Annecy
Barcelona
Barquisimeto
Bend
Bergamo
```

Berlin
Berlin
Bern

Section 53.3: UNION ALL With WHERE

UNION ALL to select all(duplicate values also) German cities from the "Customers" and "Suppliers" tables. Here Country="Germany" is to be specified in the where clause.

Query:

```
SELECT City, Country FROM Customers
WHERE Country='Germany'
UNION ALL
SELECT City, Country FROM Suppliers
WHERE Country='Germany'
ORDER BY City;
```

Result:

Number of Records: 14

City	Country
Aachen	Germany
Berlin	Germany
Berlin	Germany
Brandenburg	Germany
Cunewalde	Germany
Cuxhaven	Germany
Frankfurt	Germany
Frankfurt a.M.	Germany
Köln	Germany
Leipzig	Germany
Mannheim	Germany
München	Germany
Münster	Germany
Stuttgart	Germany

Chapter 54: MySQL client

Parameter	Description
-D --database =name	name of the database
--delimiter =str	set the statement delimiter. The default one is ';'
-e --execute = 'command'	execute command
-h --host =name	hostname to connect to
-p --password =name	password <i>Note: there is no space between -p and the password</i>
-p (without password)	the password will be prompted for
-P --port =#	port number
-s --silent	silent mode, produce less output. Use \t as column separator
-ss	like -s, but omit column names
-S --socket =path	specify the socket (Unix) or named pipe (Windows) to use when connecting to a local instance
--skip-column-names	omit column names
-u --user =name	username
-U --safe-updates --i-am-a-dummy	login with the variable sql_safe_updates=ON. This will allow only DELETE and UPDATE that explicitly use keys
-V --version	print the version and exit

Section 54.1: Base login

To access MySQL from the command line:

```
mysql --user=username --password=pwd --host=hostname test_db
```

This can be shortened to:

```
mysql -u username -p password -h hostname test_db
```

By omitting the **password** value MySQL will ask for any required password as the first input. If you specify **password** the client will give you an 'insecure' warning:

```
mysql -u=username -p -h=hostname test_db
```

For local connections **--socket** can be used to point to the socket file:

```
mysql --user=username --password=pwd --host=localhost --socket=/path/to/mysqld.sock test_db
```

Omitting the socket parameter will cause the client to attempt to attach to a server on the local machine. The server must be running to connect to it.

Section 54.2: Execute commands

This set of example show how to execute commands stored in strings or script files, without the need of the interactive prompt. This is especially useful to when a shell script needs to interact with a database.

Execute command from a string

```
$ mysql -uroot -proot test -e'select * from people'
```

```
+----+-----+-----+
| id | name  | gender |
+----+-----+-----+
```

```
| 1 | Kathy | f |
| 2 | John  | m |
+---+-----+-----+
```

To format the output as a tab-separated grid, use the `--silent` parameter:

```
$ mysql -uroot -proot test -s -e'select * from people'
```

```
id      name  gender
1       Kathy f
2       John  m
```

To omit the headers:

```
$ mysql -uroot -proot test -ss -e'select * from people'
```

```
1       Kathy f
2       John  m
```

Execute from script file:

```
$ mysql -uroot -proot test < my_script.sql
```

```
$ mysql -uroot -proot test -e'source my_script.sql'
```

Write the output on a file

```
$ mysql -uroot -proot test < my_script.sql > out.txt
```

```
$ mysql -uroot -proot test -s -e'select * from people' > out.txt
```

Chapter 55: Temporary Tables

Section 55.1: Create Temporary Table

Temporary tables could be very useful to keep temporary data. Temporary tables option is available in MySQL version 3.23 and above.

Temporary table will be automatically destroyed when the session ends or connection is closed. The user can also drop temporary table.

Same temporary table name can be used in many connections at the same time, because the temporary table is only available and accessible by the client who creates that table.

The temporary table can be created in the following types

```
--->Basic temporary table creation
CREATE TEMPORARY TABLE tempTable1(
    id INT NOT NULL AUTO_INCREMENT,
    title VARCHAR(100) NOT NULL,
    PRIMARY KEY ( id )
);

--->Temporary table creation from select query
CREATE TEMPORARY TABLE tempTable1
SELECT ColumnName1,ColumnName2,... FROM table1;
```

You can add indexes as you build the table:

```
CREATE TEMPORARY TABLE tempTable1
( PRIMARY KEY(ColumnName2) )
SELECT ColumnName1,ColumnName2,... FROM table1;
```

IF NOT EXISTS key word can be used as mentioned below to avoid '*table already exists*' error. But in that case table will not be created, if the table name which you are using already exists in your current session.

```
CREATE TEMPORARY TABLE IF NOT EXISTS tempTable1
SELECT ColumnName1,ColumnName2,... FROM table1;
```

Section 55.2: Drop Temporary Table

Drop Temporary Table is used to delete the temporary table which you are created in your current session.

```
DROP TEMPORARY TABLE tempTable1

DROP TEMPORARY TABLE IF EXISTS tempTable1
```

Use **IF EXISTS** to prevent an error occurring for tables that may not exist

Chapter 56: Customize PS1

Section 56.1: Customize the MySQL PS1 with current database

In the `.bashrc` or `.bash_profile`, adding:

```
export MYSQL_PS1="\u@\h [\d]>"
```

make the MySQL client PROMPT show current user@host [database].

```
✓ [23:06:51] wenzhong@musicforever:~
$ mysql -uroot data
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 2
Server version: 5.6.23 Homebrew

Copyright (c) 2000, 2015, Oracle and/or its affiliates. All rights reserved.

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

root@localhost [data]>
```

Section 56.2: Custom PS1 via MySQL configuration file

In `mysqld.cnf` or equivalent:

```
[mysql]
prompt = '\u@\h [\d]> '
```

This achieves a similar effect, without having to deal with `.bashrc`'s.

Chapter 57: Dealing with sparse or missing data

Section 57.1: Working with columns containing NULL values

In MySQL and other SQL dialects, **NULL** values have special properties.

Consider the following table containing job applicants, the companies they worked for, and the date they left the company. **NULL** indicates that an applicant still works at the company:

```
CREATE TABLE example
(`applicant_id` INT, `company_name` VARCHAR(255), `end_date` DATE);
```

applicant_id	company_name	end_date
1	Google	NULL
1	Initech	2013-01-31
2	Woodworking.com	2016-08-25
2	NY Times	2013-11-10
3	NFL.com	2014-04-13

Your task is to compose a query that returns all rows after **2016-01-01**, including any employees that are still working at a company (those with **NULL** end dates). This select statement:

```
SELECT * FROM example WHERE end_date > '2016-01-01';
```

fails to include any rows with **NULL** values:

applicant_id	company_name	end_date
2	Woodworking.com	2016-08-25

Per the [MySQL documentation](#), comparisons using the arithmetic operators **<**, **>**, **=**, and **<>** themselves return **NULL** instead of a boolean **TRUE** or **FALSE**. Thus a row with a **NULL** end_date is neither greater than 2016-01-01 nor less than 2016-01-01.

This can be solved by using the keywords **IS NULL**:

```
SELECT * FROM example WHERE end_date > '2016-01-01' OR end_date IS NULL;
```

applicant_id	company_name	end_date
1	Google	NULL
2	Woodworking.com	2016-08-25

Working with NULLs becomes more complex when the task involves aggregation functions like **MAX()** and a **GROUP**

BY clause. If your task were to select the most recent employed date for each applicant_id, the following query would seem a logical first attempt:

```
SELECT applicant_id, MAX(end_date) FROM example GROUP BY applicant_id;
```

applicant_id	MAX(end_date)
1	2013-01-31
2	2016-08-25
3	2014-04-13

However, knowing that **NULL** indicates an applicant is still employed at a company, the first row of the result is inaccurate. Using **CASE WHEN** provides a workaround for the **NULL** issue:

```
SELECT
  applicant_id,
  CASE WHEN MAX(end_date is null) = 1 THEN 'present' ELSE MAX(end_date) END
  max_date
FROM example
GROUP BY applicant_id;
```

applicant_id	max_date
1	present
2	2016-08-25
3	2014-04-13

This result can be joined back to the original example table to determine the company at which an applicant last worked:

```
SELECT
  data.applicant_id,
  data.company_name,
  data.max_date
FROM (
  SELECT
    *,
    CASE WHEN end_date is null THEN 'present' ELSE end_date END max_date
  FROM example
) data
INNER JOIN (
  SELECT
    applicant_id,
    CASE WHEN MAX(end_date is null) = 1 THEN 'present' ELSE MAX(end_date) END max_date
  FROM
    example
  GROUP BY applicant_id
) j
ON data.applicant_id = j.applicant_id AND data.max_date = j.max_date;
```

applicant_id	company_name	max_date
1	present	
2	example	2016-08-25
3	example	2014-04-13

	1	Google	present	
	2	Woodworking.com	2016-08-25	
	3	NFL.com	2014-04-13	
+-----+-----+-----+				

These are just a few examples of working with **NULL** values in MySQL.

Chapter 58: Connecting with UTF-8 Using Various Programming Language.

Section 58.1: Python

1st or 2nd line in source code (to have literals in the code utf8-encoded):

```
# -*- coding: utf-8 -*-
```

Connection:

```
db = MySQLdb.connect(host=DB_HOST, user=DB_USER, passwd=DB_PASS, db=DB_NAME,  
                    charset="utf8mb4", use_unicode=True)
```

For web pages, one of these:

```
<meta charset="utf-8" />  
<meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
```

Section 58.2: PHP

In php.ini (this is the default after PHP 5.6):

```
default_charset UTF-8
```

When building a web page:

```
header('Content-type: text/plain; charset=UTF-8');
```

When connecting to MySQL:

```
(for mysql:)  Do not use the mysql_* API!  
(for mysqli:) $mysqli_obj->set_charset('utf8mb4');  
(for PDO:)    $db = new PDO('dblib:host=host;dbname=db;charset=utf8', $user, $pwd);
```

In code, do not use any conversion routines.

For data entry,

```
<form accept-charset="UTF-8">
```

For JSON, to avoid \uxxxx:

```
$t = json_encode($s, JSON_UNESCAPED_UNICODE);
```

Chapter 59: Time with subsecond precision

Section 59.1: Get the current time with millisecond precision

```
SELECT NOW(3)
```

does the trick.

Section 59.2: Get the current time in a form that looks like a Javascript timestamp

Javascript timestamps are based on the venerable UNIX `time_t` data type, and show the number of milliseconds since `1970-01-01 00:00:00 UTC`.

This expression gets the current time as a Javascript timestamp integer. (It does so correctly regardless of the `current_time_zone` setting.)

```
ROUND(UNIX_TIMESTAMP(NOW(3)) * 1000.0, 0)
```

If you have **TIMESTAMP** values stored in a column, you can retrieve them as integer Javascript timestamps using the `UNIX_TIMESTAMP()` function.

```
SELECT ROUND(UNIX_TIMESTAMP(column) * 1000.0, 0)
```

If your column contains **DATETIME** columns and you retrieve them as Javascript timestamps, those timestamps will be offset by the time zone offset of the time zone they're stored in.

Section 59.3: Create a table with columns to store sub-second time

```
CREATE TABLE times (  
  dt DATETIME(3),  
  ts TIMESTAMP(3)  
);
```

makes a table with millisecond-precision date / time fields.

```
INSERT INTO times VALUES (NOW(3), NOW(3));
```

inserts a row containing `NOW()` values with millisecond precision into the table.

```
INSERT INTO times VALUES ('2015-01-01 16:34:00.123', '2015-01-01 16:34:00.128');
```

inserts specific millisecond precision values.

Notice that you must use `NOW(3)` rather than `NOW()` if you use that function to insert high-precision time values.

Section 59.4: Convert a millisecond-precision date / time value to text

`%f` is the fractional precision format specifier for [the DATE_FORMAT\(\) function](#).

```
SELECT DATE_FORMAT(NOW(3), '%Y-%m-%d %H:%i:%s.%f')
```

displays a value like `2016-11-19 09:52:53.248000` with fractional microseconds. Because we used `NOW(3)`, the final three digits in the fraction are 0.

Section 59.5: Store a Javascript timestamp into a `TIMESTAMP` column

If you have a Javascript timestamp value, for example `1478960868932`, you can convert that to a MySQL fractional time value like this:

```
FROM_UNIXTIME(1478960868932 * 0.001)
```

It's simple to use that kind of expression to store your Javascript timestamp into a MySQL table. Do this:

```
INSERT INTO table (col) VALUES (FROM_UNIXTIME(1478960868932 * 0.001))
```

(Obviously, you'll want to insert other columns.)

Chapter 60: One to Many

The idea of one to many (1:M) concerns the joining of rows to each other, specifically cases where a single row in one table corresponds to many rows in another.

1:M is one-directional, that is, any time you query a 1:M relationship, you can use the 'one' row to select 'many' rows in another table, but you cannot use a single 'many' row to select more than a single 'one' row.

Section 60.1: Example Company Tables

Consider a company where every employee who is a manager, manages 1 or more employees, and every employee has only 1 manager.

This results in two tables:

EMPLOYEES

EMP_ID	FIRST_NAME	LAST_NAME	MGR_ID
E01	Johnny	Appleseed	M02
E02	Erin	Macklemore	M01
E03	Colby	Paperwork	M03
E04	Ron	Sonswan	M01

MANAGERS

MGR_ID	FIRST_NAME	LAST_NAME
M01	Loud	McQueen
M02	Bossy	Pants
M03	Barrel	Jones

Section 60.2: Get the Employees Managed by a Single Manager

```
SELECT e.emp_id , e.first_name , e.last_name FROM employees e INNER JOIN managers m ON m.mgr_id = e.mgr_id WHERE m.mgr_id = 'M01' ;
```

Results in:

EMP_ID	FIRST_NAME	LAST_NAME
E02	Erin	Macklemore
E04	Ron	Sonswan

Ultimately, for every manager we query for, we will see 1 or more employees returned.

Section 60.3: Get the Manager for a Single Employee

Consult the above example tables when looking at this example.

```
SELECT m.mgr_id , m.first_name , m.last_name FROM managers m INNER JOIN employees e ON e.mgr_id = m.mgr_id WHERE e.emp_id = 'E03' ;
```

MGR_ID	FIRST_NAME	LAST_NAME
M03	Barrel	Jones

As this is the inverse of the above example, we know that for every employee we query for, we will only ever see

one corresponding manager.

Chapter 61: Server Information

Parameters	Explanation
GLOBAL	Shows the variables as they are configured for the entire server. Optional.
SESSION	Shows the variables that are configured for this session only. Optional.

Section 61.1: SHOW VARIABLES example

To get all the server variables run this query either in the SQL window of your preferred interface (PHPMyAdmin or other) or in the MySQL CLI interface

```
SHOW VARIABLES;
```

You can specify if you want the session variables or the global variables as follows:

Session variables:

```
SHOW SESSION VARIABLES;
```

Global variables:

```
SHOW GLOBAL VARIABLES;
```

Like any other SQL command you can add parameters to your query such as the LIKE command:

```
SHOW [GLOBAL | SESSION] VARIABLES LIKE 'max_join_size';
```

Or, using wildcards:

```
SHOW [GLOBAL | SESSION] VARIABLES LIKE '%size%';
```

You can also filter the results of the SHOW query using a WHERE parameter as follows:

```
SHOW [GLOBAL | SESSION] VARIABLES WHERE VALUE > 0;
```

Section 61.2: SHOW STATUS example

To get the database server status run this query in either the SQL window of your preferred interface (PHPMyAdmin or other) or on the MySQL CLI interface.

```
SHOW STATUS;
```

You can specify whether you wish to receive the SESSION or GLOBAL status of your sever like so: Session status:

```
SHOW SESSION STATUS;
```

Global status:

```
SHOW GLOBAL STATUS;
```

Like any other SQL command you can add parameters to your query such as the LIKE command:

```
SHOW [GLOBAL | SESSION] STATUS LIKE 'Key%';
```

Or the Where command:

```
SHOW [GLOBAL | SESSION] STATUS WHERE VALUE > 0;
```

The main difference between GLOBAL and SESSION is that with the GLOBAL modifier the command displays aggregated information about the server and all of its connections, while the SESSION modifier will only show the values for the current connection.

Chapter 62: SSL Connection Setup

Section 62.1: Setup for Debian-based systems

(This assumes MySQL has been installed and that sudo is being used.)

Generating a CA and SSL keys

Make sure OpenSSL and libraries are installed:

```
apt-get -y install openssl
apt-get -y install libssl-dev
```

Next make and enter a directory for the SSL files:

```
mkdir /home/ubuntu/mysqlcerts
cd /home/ubuntu/mysqlcerts
```

To generate keys, create a certificate authority (CA) to sign the keys (self-signed):

```
openssl genrsa 2048 > ca-key.pem
openssl req -new -x509 -nodes -days 3600 -key ca-key.pem -out ca.pem
```

The values entered at each prompt won't affect the configuration. Next create a key for the server, and sign using the CA from before:

```
openssl req -newkey rsa:2048 -days 3600 -nodes -keyout server-key.pem -out server-req.pem
openssl rsa -in server-key.pem -out server-key.pem

openssl x509 -req -in server-req.pem -days 3600 -CA ca.pem -CAkey ca-key.pem -set_serial 01 -out
server-cert.pem
```

Then create a key for a client:

```
openssl req -newkey rsa:2048 -days 3600 -nodes -keyout client-key.pem -out client-req.pem
openssl rsa -in client-key.pem -out client-key.pem
openssl x509 -req -in client-req.pem -days 3600 -CA ca.pem -CAkey ca-key.pem -set_serial 01 -out
client-cert.pem
```

To make sure everything was set up correctly, verify the keys:

```
openssl verify -CAfile ca.pem server-cert.pem client-cert.pem
```

Adding the keys to MySQL

Open the MySQL configuration file. For example:

```
vim /etc/mysql/mysql.conf.d/mysqld.cnf
```

Under the `[mysqld]` section, add the following options:

```
ssl-ca = /home/ubuntu/mysqlcerts/ca.pem
ssl-cert = /home/ubuntu/mysqlcerts/server-cert.pem
ssl-key = /home/ubuntu/mysqlcerts/server-key.pem
```

Restart MySQL. For example:

```
service mysql restart
```

Test the SSL connection

Connect in the same way, passing in the extra options `ssl-ca`, `ssl-cert`, and `ssl-key`, using the generated client key. For example, assuming `cd /home/ubuntu/mysqlcerts`:

```
mysql --ssl-ca=ca.pem --ssl-cert=client-cert.pem --ssl-key=client-key.pem -h 127.0.0.1 -u superman -p
```

After logging in, verify the connection is indeed secure:

```
superman@127.0.0.1 [None]> SHOW VARIABLES LIKE '%ssl%';
+-----+-----+
| Variable_name | Value                                     |
+-----+-----+
| have_openssl  | YES                                     |
| have_ssl      | YES                                     |
| ssl_ca        | /home/ubuntu/mysqlcerts/ca.pem         |
| ssl_capath    |                                         |
| ssl_cert      | /home/ubuntu/mysqlcerts/server-cert.pem |
| ssl_cipher    |                                         |
| ssl_crl       |                                         |
| ssl_crlpath   |                                         |
| ssl_key       | /home/ubuntu/mysqlcerts/server-key.pem  |
+-----+-----+
```

You could also check:

```
superman@127.0.0.1 [None]> STATUS;
...
SSL:                Cipher in use is DHE-RSA-AES256-SHA
...
```

Enforcing SSL

This is via `GRANT`, using `REQUIRE SSL`:

```
GRANT ALL PRIVILEGES ON *.* TO 'superman'@'127.0.0.1' IDENTIFIED BY 'pass' REQUIRE SSL;
FLUSH PRIVILEGES;
```

Now, superman *must* connect via SSL.

If you don't want to manage client keys, use the client key from earlier and automatically use that for all clients. Open MySQL configuration file, for example:

```
vim /etc/mysql/mysql.conf.d/mysqld.cnf
```

Under the `[client]` section, add the following options:

```
ssl-ca = /home/ubuntu/mysqlcerts/ca.pem
ssl-cert = /home/ubuntu/mysqlcerts/client-cert.pem
ssl-key = /home/ubuntu/mysqlcerts/client-key.pem
```

Now superman only has to type the following to login via SSL:

```
mysql -h 127.0.0.1 -u superman -p
```

Connecting from another program, for example in Python, typically only requires an additional parameter to the connect function. A Python example:

```
import MySQLdb
ssl = {'cert': '/home/ubuntu/mysqlcerts/client-cert.pem', 'key': '/home/ubuntu/mysqlcerts/client-key.pem'}
conn = MySQLdb.connect(host='127.0.0.1', user='superman', passwd='imsoawesome', ssl=ssl)
```

Section 62.2: Setup for CentOS7 / RHEL7

This example assumes two servers:

1. dbserver (where our database lives)
2. apclient (where our applications live)

FWIW, both servers are SELinux enforcing.

First, log on to dbserver

Create a temporary directory for creating the certificates.

```
mkdir /root/certs/mysql/ && cd /root/certs/mysql/
```

Create the server certificates

```
openssl genrsa 2048 > ca-key.pem
openssl req -sha1 -new -x509 -nodes -days 3650 -key ca-key.pem > ca-cert.pem
openssl req -sha1 -newkey rsa:2048 -days 730 -nodes -keyout server-key.pem > server-req.pem
openssl rsa -in server-key.pem -out server-key.pem
openssl x509 -sha1 -req -in server-req.pem -days 730 -CA ca-cert.pem -CAkey ca-key.pem -set_serial 01 > server-cert.pem
```

Move server certificates to /etc/pki/tls/certs/mysql/

Directory path assumes CentOS or RHEL (adjust as needed for other distros):

```
mkdir /etc/pki/tls/certs/mysql/
```

Be sure to set permissions on the folder and files. mysql needs full ownership and access.

```
chown -R mysql:mysql /etc/pki/tls/certs/mysql
```

Now configure MySQL/MariaDB

```
# vi /etc/my.cnf
# i
```

```
[mysqld]  
bind-address=  
ssl-ca=/etc/pki/tls/certs/ca-cert.pem  
ssl-cert=/etc/pki/tls/certs/server-cert.pem  
ssl-key=/etc/pki/tls/certs/server-key.pem  
# :wq
```

Then

```
systemctl restart mariadb
```

Don't forget to open your firewall to allow connections from appclient (using IP 1.2.3.4)

```
firewall-cmd --zone=drop --permanent --add-rich-rule 'rule family="ipv4" source address="1.2.3.4"  
service name="mysql" accept'  
# I force everything to the drop zone. Season the above command to taste.
```

Now restart firewalld

```
service firewalld restart
```

Next, log in to dbserver's mysql server:

```
mysql -uroot -p
```

Issue the following to create a user for the client. note REQUIRE SSL in GRANT statement.

```
GRANT ALL PRIVILEGES ON *.* TO 'iamsecure'@'appclient' IDENTIFIED BY 'dingdingding' REQUIRE SSL;  
FLUSH PRIVILEGES;  
# quit mysql
```

You should still be in /root/certs/mysql from the first step. If not, cd back to it for one of the commands below.

Create the client certificates

```
openssl req -sha1 -newkey rsa:2048 -days 730 -nodes -keyout client-key.pem > client-req.pem  
openssl rsa -in client-key.pem -out client-key.pem  
openssl x509 -sha1 -req -in client-req.pem -days 730 -CA ca-cert.pem -CAkey ca-key.pem -set_serial  
01 > client-cert.pem
```

Note: I used the same common name for both server and client certificates. YMMV.

Be sure you're still /root/certs/mysql/ for this next command

Combine server and client CA certificate into a single file:

```
cat server-cert.pem client-cert.pem > ca.pem
```

Make sure you see two certificates:

```
cat ca.pem
```

END OF SERVER SIDE WORK FOR NOW.

Open another terminal and

```
ssh appclient
```

As before, create a permanent home for the client certificates

```
mkdir /etc/pki/tls/certs/mysql/
```

Now, place the client certificates (created on dbserver) on appclient. You can either scp them over, or just copy and paste the files one by one.

```
scp dbserver  
# copy files from dbserver to appclient  
# exit scp
```

Again, be sure to set permissions on the folder and files. mysql needs full ownership and access.

```
chown -R mysql:mysql /etc/pki/tls/certs/mysql
```

You should have three files, each owned by user mysql:

```
/etc/pki/tls/certs/mysql/ca.pem  
/etc/pki/tls/certs/mysql/client-cert.pem  
/etc/pki/tls/certs/mysql/client-key.pem
```

Now edit appclient's MariaDB/MySQL config in the [client] section.

```
vi /etc/my.cnf  
# i  
[client]  
ssl-ca=/etc/pki/tls/certs/mysql/ca.pem  
ssl-cert=/etc/pki/tls/certs/mysql/client-cert.pem  
ssl-key=/etc/pki/tls/certs/mysql/client-key.pem  
# :wq
```

Restart appclient's mariadb service:

```
systemctl restart mariadb
```

still on the client here

This should return: ssl TRUE

```
mysql --ssl --help
```

Now, log in to appclient's mysql instance

```
mysql -uroot -p
```

Should see YES to both variables below

```
show variables LIKE '%ssl';  
have_openssl      YES  
have_ssl          YES
```

Initially I saw

```
have_openssl NO
```

A quick look into mariadb.log revealed:

```
SSL error: Unable to get certificate from '/etc/pki/tls/certs/mysql/client-cert.pem'
```

The problem was that root owned client-cert.pem and the containing folder. The solution was to set ownership of /etc/pki/tls/certs/mysql/ to mysql.

```
chown -R mysql:mysql /etc/pki/tls/certs/mysql
```

Restart mariadb if needed from the step immediately above

NOW WE ARE READY TO TEST THE SECURE CONNECTION

We're still on appclient here

Attempt to connect to dbserver's mysql instance using the account created above.

```
mysql -h dbserver -u iamsecure -p
# enter password dingdingding (hopefully you changed that to something else)
```

With a little luck you should be logged in without error.

To confirm you are connected with SSL enabled, issue the following command from the MariaDB/MySQL prompt:

```
\s
```

That's a backslash s, aka status

That will show the status of your connection, which should look something like this:

```
Connection id:          4
Current database:
Current user:           iamsecure@appclient
SSL:                    Cipher in use is DHE-RSA-AES256-GCM-SHA384
Current pager:          stdout
Using outfile:           ''
Using delimiter:        ;
Server:                  MariaDB
Server version:          5.X.X-MariaDB MariaDB Server
Protocol version:       10
Connection:              dbserver via TCP/IP
Server characterset:     latin1
Db characterset:         latin1
Client characterset:     utf8
Conn. characterset:      utf8
TCP port:                3306
Uptime:                  42 min 13 sec
```

If you get permission denied errors on your connection attempt, check your GRANT statement above to make sure there aren't any stray characters or ' marks.

If you have SSL errors, go back through this guide to make sure the steps are orderly.

This worked on RHEL7 and will likely work on CentOS7, too. Cannot confirm whether these exact steps will work elsewhere.

Hope this saves someone else a little time and aggravation.

Chapter 63: Create New User

Section 63.1: Create a MySQL User

For creating new user, We need to follow simple steps as below :

Step 1: Login to MySQL as root

```
$ mysql -u root -p
```

Step 2 : We will see mysql command prompt

```
mysql> CREATE USER 'my_new_user'@'localhost' IDENTIFIED BY 'test_password';
```

Here, We have successfully created new user, But this user won't have any permissions, So to assign permissions to user use following command :

```
mysql> GRANT ALL PRIVILEGES ON my_db.* TO 'my_new_user'@'localhost' identified by 'my_password';
```

Section 63.2: Specify the password

The basic usage is:

```
mysql> CREATE USER 'my_new_user'@'localhost' IDENTIFIED BY 'test_password';
```

However for situations where is not advisable to hard-code the password in cleartext it is also possible to specify directly, using the directive `PASSWORD`, the hashed value as returned by the `PASSWORD()` function:

```
mysql> select PASSWORD('test_password'); -- returns *4414E26EDED6D661B5386813EBBA95065DBC4728
mysql> CREATE USER 'my_new_user'@'localhost' IDENTIFIED BY PASSWORD
'*4414E26EDED6D661B5386813EBBA95065DBC4728';
```

Section 63.3: Create new user and grant all privileges to schema

```
grant all privileges on schema_name.* to 'new_user_name'@'%' identified by 'newpassword';
```

Attention: This can be used to create new root user

Section 63.4: Renaming user

```
rename user 'user'@'%' to 'new_name'@'%';
```

If you create a user by mistake, you can change his name

Chapter 64: Security via GRANTS

Section 64.1: Best Practice

Limit root (and any other SUPER-privileged user) to

```
GRANT ... TO root@localhost ...
```

That prevents access from other servers. You should hand out SUPER to very few people, and they should be aware of their responsibility. The application should not have SUPER.

Limit application logins to the one database it uses:

```
GRANT ... ON dbname.* ...
```

That way, someone who hacks into the application code can't get past dbname. This can be further refined via either of these:

```
GRANT SELECT ON dbname.* ... -- "read only"
GRANT ... ON dbname.tblname ... -- "just one table"
```

The readonly may also need 'safe' things like

```
GRANT SELECT, CREATE TEMPORARY TABLE ON dbname.* ... -- "read only"
```

As you say, there is no absolute security. My point here is there you can do a few things to slow hackers down. (Same goes for honest people goofing.)

In rare cases, you may need the application to do something available only to root. this can be done via a "Stored Procedure" that has SECURITY **DEFINER** (and root defines it). That will expose only what the SP does, which might, for example, be one particular action on one particular table.

Section 64.2: Host (of user@host)

The "host" can be either a host name or an IP address. Also, it can involve wild cards.

```
GRANT SELECT ON db.* TO sam@'my.domain.com' IDENTIFIED BY 'foo';
```

Examples: Note: these usually need to be quoted

```
localhost -- the same machine as mysqld
'my.domain.com' -- a specific domain; this involves a lookup
'11.22.33.44' -- a specific IP address
'192.168.1.%' -- wild card for trailing part of IP address. (192.168.% and 10.% and 11.% are
"internal" ip addresses.)
```

Using localhost relies on the security of the server. For best practice root should only be allowed in through localhost. In some cases, these mean the same thing: 0.0.0.1 and :::1.

Chapter 65: Change Password

Section 65.1: Change MySQL root password in Linux

To change MySQL's root user password:

Step 1: Stop the MySQL server.

- in Ubuntu or Debian:
`sudo /etc/init.d/mysql stop`
- in CentOS, Fedora or Red Hat Enterprise Linux:
`sudo /etc/init.d/mysqld stop`

Step 2: Start the MySQL server without the privilege system.

```
sudo mysqld_safe --skip-grant-tables &
```

or, if `mysqld_safe` is unavailable,

```
sudo mysqld --skip-grant-tables &
```

Step 3: Connect to the MySQL server.

```
mysql -u root
```

Step 4: Set a new password for root user.

Version > 5.7

```
FLUSH PRIVILEGES;  
ALTER USER 'root'@'localhost' IDENTIFIED BY 'new_password';  
FLUSH PRIVILEGES;  
exit;
```

Version ≤ 5.7

```
FLUSH PRIVILEGES;  
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new_password');  
FLUSH PRIVILEGES;  
exit;
```

Note: The **ALTER USER** syntax was introduced in MySQL 5.7.6.

Step 5: Restart the MySQL server.

- in Ubuntu or Debian:
`sudo /etc/init.d/mysql stop`
`sudo /etc/init.d/mysql start`
- in CentOS, Fedora or Red Hat Enterprise Linux:
`sudo /etc/init.d/mysqld stop`
`sudo /etc/init.d/mysqld start`

Section 65.2: Change MySQL root password in Windows

When we want to change root password in windows, We need to follow following steps :

Step 1 : Start your Command Prompt by using any of below method :

Press Ctrl+R or Goto **Start** Menu > Run and then type cmd and hit enter

Step 2 : Change your directory to where MySQL is installed, In my case it's

```
C:\> cd C:\mysql\bin
```

Step 3 : Now we need to start mysql command prompt

```
C:\mysql\bin> mysql -u root mysql
```

Step 4 : Fire query to change root password

```
mysql> SET PASSWORD FOR root@localhost=PASSWORD('my_new_password');
```

Section 65.3: Process

1. Stop the MySQL (mysqld) server/daemon process.
2. Start the MySQL server process the --skip-grant-tables option so that it will not prompt for a password:
`mysqld_safe --skip-grant-tables &`
3. Connect to the MySQL server as the root user: `mysql -u root`
4. Change password:
 - (5.7.6 and newer): `ALTER USER 'root'@'localhost' IDENTIFIED BY 'new-password';`
 - (5.7.5 and older, or MariaDB): `SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new-password'); flush privileges; quit;`
5. Restart the MySQL server.

Note: this will work only if you are physically on the same server.

Online Doc: <http://dev.mysql.com/doc/refman/5.7/en/resetting-permissions.html>

Chapter 66: Recover and reset the default root password for MySQL 5.7+

After MySQL 5.7, when we install MySQL sometimes we don't need to create a root account or give a root password. By default when we start the server, the default password is stored in the `mysqld.log` file. We need to login in to the system using that password and we need to change it.

Section 66.1: What happens when the initial start up of the server

Given that the data directory of the server is empty:

- The server is initialized.
- SSL certificate and key files are generated in the data directory.
- The `validate_password` plugin is installed and enabled.
- The superuser account 'root'@'localhost' is created. The password for the superuser is set and stored in the error log file.

Section 66.2: How to change the root password by using the default password

To reveal the default "root" password:

```
shell> sudo grep 'temporary password' /var/log/mysqld.log
```

Change the root password as soon as possible by logging in with the generated temporary password and set a custom password for the superuser account:

```
shell> mysql -uroot -p
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass5!';
```

Note: MySQL's `validate_password` plugin is installed by default. This will require that passwords contain at least one upper case letter, one lower case letter, one digit, and one special character, and that the total password length is at least 8 characters.

Section 66.3: reset root password when " /var/run/mysqld" for UNIX socket file don't exists"

if I forget the password then I'll get error.

```
$ mysql -u root -p
```

Enter password:

ERROR 1045 (28000): Access denied for user 'root'@'localhost' (using password: YES)

I tried to solve the issue by first knowing the status:

```
$ systemctl status mysql.service
```

mysql.service - MySQL Community Server Loaded: loaded (/lib/systemd/system/mysql.service; enabled; vendor

preset: en Active: active (running) since Thu 2017-06-08 14:31:33 IST; 38s ago

Then I used the code `mysqld_safe --skip-grant-tables &` but I get the error:

```
mysqld_safe Directory '/var/run/mysqld' for UNIX socket file don't exists.
```

```
$ systemctl stop mysql.service
$ ps -eaf | grep mysql
$ mysqld_safe --skip-grant-tables &
```

I solved:

```
$ mkdir -p /var/run/mysqld
$ chown mysql:mysql /var/run/mysqld
```

Now I use the same code `mysqld_safe --skip-grant-tables &` and get

```
mysqld_safe Starting mysqld daemon with databases from /var/lib/mysql
```

If I use `$ mysql -u root` I'll get :

Server version: 5.7.18-0ubuntu0.16.04.1 (Ubuntu)

Copyright (c) 2000, 2017, Oracle and/or its affiliates. All rights reserved.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql>

Now time to change password:

```
mysql> use mysql
mysql> describe user;
```

Reading table information for completion of table and column names You can turn off this feature to get a quicker startup with -A

Database changed

```
mysql> FLUSH PRIVILEGES;
mysql> SET PASSWORD FOR root@'localhost' = PASSWORD('newpwd');
```

or If you have a mysql root account that can connect from everywhere, you should also do:

```
UPDATE mysql.user SET Password=PASSWORD('newpwd') WHERE User='root';
```

Alternate Method:

```
USE mysql
UPDATE user SET Password = PASSWORD('newpwd')
WHERE Host = 'localhost' AND User = 'root';
```

And if you have a root account that can access from everywhere:

```
USE mysql
UPDATE user SET Password = PASSWORD('newpwd')
WHERE Host = '%' AND User = 'root';`enter code here
```

now need to quit from mysql and stop/start

```
FLUSH PRIVILEGES;
sudo /etc/init.d/mysql stop
sudo /etc/init.d/mysql start
```

now again `mysql -u root -p' and use the new password to get

```
mysql>
```

Chapter 67: Recover from lost root password

Section 67.1: Set root password, enable root user for socket and http access

Solves problem of: access denied for user root using password YES Stop MySQL:

```
sudo systemctl stop mysql
```

Restart MySQL, skipping grant tables:

```
sudo mysqld_safe --skip-grant-tables
```

Login:

```
mysql -u root
```

In SQL shell, look if users exist:

```
select User, password, plugin FROM mysql.user ;
```

Update the users (plugin null enables for all plugins):

```
update mysql.user set password=PASSWORD('mypassword'), plugin = NULL WHERE User = 'root';  
exit;
```

In Unix shell stop MySQL without grant tables, then restart with grant tables:

```
sudo service mysql stop  
sudo service mysql start
```

Chapter 68: MySQL Performance Tips

Section 68.1: Building a composite index

In many situations, a composite index performs better than an index with a single column. To build an optimal composite index, populate it with columns in this order.

- = column(s) from the **WHERE** clause first. (eg, **INDEX**(a, b, ...) for **WHERE** a=12 **AND** b='xyz' ...)
- IN column(s); the optimizer may be able to leapfrog through the index.
- One "range" (eg x **BETWEEN** 3 **AND** 9, name **LIKE** 'J%') It won't use anything past the first range column.
- All the columns in **GROUP BY**, in order
- All the columns in **ORDER BY**, in order. Works only if all are **ASC** or all are **DESC** or you are using 8.0.

Notes and exceptions:

- Don't duplicate any columns.
- Skip over any cases that don't apply.
- If you don't use all the columns of **WHERE**, there is no need to go on to **GROUP BY**, etc.
- There are cases where it is useful to index only the **ORDER BY** column(s), ignoring **WHERE**.
- Don't "hide" a column in a function (eg **DATE**(x) = ... cannot use x in the index.)
- 'Prefix' indexing (eg, text_col(99)) is unlikely to be helpful; may hurt.

[More details and tips](#) .

Section 68.2: Optimizing Storage Layout for InnoDB Tables

1. In InnoDB, having a long PRIMARY KEY (either a single column with a lengthy value, or several columns that form a long composite value) wastes a lot of disk space. The primary key value for a row is duplicated in all the secondary index records that point to the same row. Create an AUTO_INCREMENT column as the primary key if your primary key is long.
2. Use the VARCHAR data type instead of CHAR to store variable-length strings or for columns with many NULL values. A CHAR(N) column always takes N characters to store data, even if the string is shorter or its value is NULL. Smaller tables fit better in the buffer pool and reduce disk I/O.

When using COMPACT row format (the default InnoDB format) and variable-length character sets, such as utf8 or sjis, CHAR(N) columns occupy a variable amount of space, but still at least N bytes.

3. For tables that are big, or contain lots of repetitive text or numeric data, consider using COMPRESSED row format. Less disk I/O is required to bring data into the buffer pool, or to perform full table scans. Before making a permanent decision, measure the amount of compression you can achieve by using COMPRESSED versus COMPACT row format. *Caveat:* Benchmarks rarely show better than 2:1 compression and there is a lot of overhead in the buffer_pool for COMPRESSED.
4. Once your data reaches a stable size, or a growing table has increased by tens or some hundreds of megabytes, consider using the OPTIMIZE TABLE statement to reorganize the table and compact any wasted space. The reorganized tables require less disk I/O to perform full table scans. This is a straightforward technique that can improve performance when other techniques such as improving index usage or tuning application code are not practical. *Caveat:* Regardless of table size, OPTIMIZE TABLE should only rarely be performed. This is because it is costly, and rarely improves the table enough to be worth it. InnoDB is reasonably good at keeping its B+Trees free of a lot of wasted space.

OPTIMIZE TABLE copies the data part of the table and rebuilds the indexes. The benefits come from improved packing of data within indexes, and reduced fragmentation within the tablespaces and on disk. The benefits vary depending on the data in each table. You may find that there are significant gains for some and not for others, or that the gains decrease over time until you next optimize the table. This operation can be slow if the table is large or if the indexes being rebuilt do not fit into the buffer pool. The first run after adding a lot of data to a table is often much slower than later runs.

Chapter 69: Performance Tuning

Section 69.1: Don't hide in function

A common mistake is to hide an indexed column inside a function call. For example, this can't be helped by an index:

```
WHERE DATE(dt) = '2000-01-01'
```

Instead, given `INDEX(dt)` then these may use the index:

```
WHERE dt = '2000-01-01' -- if `dt` is datatype `DATE`
```

This works for `DATE`, `DATETIME`, `TIMESTAMP`, and even `DATETIME(6)` (microseconds):

```
WHERE dt >= '2000-01-01'
AND dt < '2000-01-01' + INTERVAL 1 DAY
```

Section 69.2: OR

In general OR kills optimization.

```
WHERE a = 12 OR b = 78
```

cannot use `INDEX(a, b)`, and may or may not use `INDEX(a)`, `INDEX(b)` via "index merge". Index merge is better than nothing, but only barely.

```
WHERE x = 3 OR x = 5
```

is turned into

```
WHERE x IN (3, 5)
```

which *may* use an index with x in it.

Section 69.3: Add the correct index

This is a huge topic, but it is also the most important "performance" issue.

The main lesson for a novice is to learn of "composite" indexes. Here's a quick example:

```
INDEX(last_name, first_name)
```

is excellent for these:

```
WHERE last_name = '...'
WHERE first_name = '...' AND last_name = '...' -- (order in WHERE does not matter)
```

but not for

```
WHERE first_name = '...' -- order in INDEX _does_ matter
WHERE last_name = '...' OR first_name = '...' -- "OR" is a killer
```

Section 69.4: Have an INDEX

The most important thing for speeding up a query on any non-tiny table is to have a suitable index.

```
WHERE a = 12 --> INDEX(a)
WHERE a > 12 --> INDEX(a)

WHERE a = 12 AND b > 78 --> INDEX(a,b) is more useful than INDEX(b,a)
WHERE a > 12 AND b > 78 --> INDEX(a) or INDEX(b); no way to handle both ranges

ORDER BY x --> INDEX(x)
ORDER BY x, y --> INDEX(x,y) in that order
ORDER BY x DESC, y ASC --> No index helps - because of mixing ASC and DESC
```

Section 69.5: Subqueries

Subqueries come in several flavors, and they have different optimization potential. First, note that subqueries can be either "correlated" or "uncorrelated". Correlated means that they depend on some value from outside the subquery. This generally implies that the subquery *must* be re-evaluated for each outer value.

This correlated subquery is often pretty good. Note: It must return at most 1 value. It is often useful as an alternative to, though not necessarily faster than, a **LEFT JOIN**.

```
SELECT a, b, ( SELECT ... FROM t WHERE t.x = u.x ) AS c
FROM u ...
SELECT a, b, ( SELECT MAX(x) ... ) AS c
FROM u ...
SELECT a, b, ( SELECT x FROM t ORDER BY ... LIMIT 1 ) AS c
FROM u ...
```

This is usually uncorrelated:

```
SELECT ...
FROM ( SELECT ... ) AS a
JOIN b ON ...
```

Notes on the FROM-SELECT:

- If it returns 1 row, great.
- A good paradigm (again "1 row") is for the subquery to be (**SELECT @n := 0**), thereby initializing an `@variable` for use in the rest of the query.
- If it returns many rows *and* the **JOIN** also is (**SELECT ...**) with many rows, then efficiency can be terrible. Pre-5.6, there was no index, so it became a **CROSS JOIN**; 5.6+ involves deducing the best index on the temp tables and then generating it, only to throw it away when finished with the **SELECT**.

Section 69.6: JOIN + GROUP BY

A common problem that leads to an inefficient query goes something like this:

```
SELECT ...
FROM a
JOIN b ON ...
WHERE ...
GROUP BY a.id
```

First, the **JOIN** expands the number of rows; then the **GROUP BY** whittles it back down the the number of rows in a.

There may not be any good choices to solve this explode-implode problem. One possible option is to turn the **JOIN** into a correlated subquery in the **SELECT**. This also eliminates the **GROUP BY**.

Section 69.7: Set the cache correctly

`innodb_buffer_pool_size` should be about 70% of available RAM.

Section 69.8: Negatives

Here are some things that are not likely to help performance. They stem from out-of-date information and/or naivety.

- InnoDB has improved to the point where MyISAM is unlikely to be better.
- **PARTITIONing** rarely provides performance benefits; it can even hurt performance.
- Setting `query_cache_size` bigger than 100M will usually *hurt* performance.
- Increasing lots of values in `my.cnf` may lead to 'swapping', which is a *serious* performance problem.
- "Prefix indexes" (such as **INDEX**(`foo(20)`)) are generally useless.
- **OPTIMIZE TABLE** is almost always useless. (And it involves locking the table.)

Appendix A: Reserved Words

MySQL has some special names called *reserved words*. A reserved word can be used as an identifier for a table, column, etc. only if it's wrapped in backticks (`), otherwise it will give rise to an error.

To avoid such errors, either don't use reserved words as identifiers or wrap the offending identifier in backticks.

Section A.1: Errors due to reserved words

When trying to select from a table called order like this

```
select * from order
```

the error rises:

Error Code: 1064. You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'order' at line 1

Reserved keywords in MySQL need to be escaped with backticks (`)

```
select * from `order`
```

to distinguish between a keyword and a table or column name.

See also: [Syntax error due to using a reserved word as a table or column name in MySQL](#).
